

Feasibility studies of neutrino-jet and hadron-in-jet azimuthal modulations in charged-current DIS at the EIC

Dr. Sebouh J. Paul

University of California, Riverside

October 1, 2021

Introduction

- Charged-current deep inelastic scattering (CC DIS) occurs via exchange of a virtual W boson between an incoming lepton and a bound quark.
- Provides flavour sensitivity with tagging of the electric charge of the struck quark.
- Here we show the feasibility of using jets to study TMD observables in CC DIS reactions at the future Electron-Ion Collider (EIC).

Electron-Ion Collider conditions in this study

- 10 GeV electrons with 275 GeV protons.
- Projected luminosity: 100 fb^{-1} (1 year $\times 10^{34} \text{ cm}^{-2} \text{ s}^{-1}$).
- Average proton polarization of 70%

Kinematic range

- $100 < Q^2 < 5000 \text{ GeV}^2/c^2$
- $0.1 < x_B < 0.8$
- $10 < p_T^{\text{jet}} < 45 \text{ GeV}/c$

Detector performance:

- Based on EIC YR params (3T).
- Tracker performance follows LBNL all-silicon design. [1]

ref. detector, EIC YR

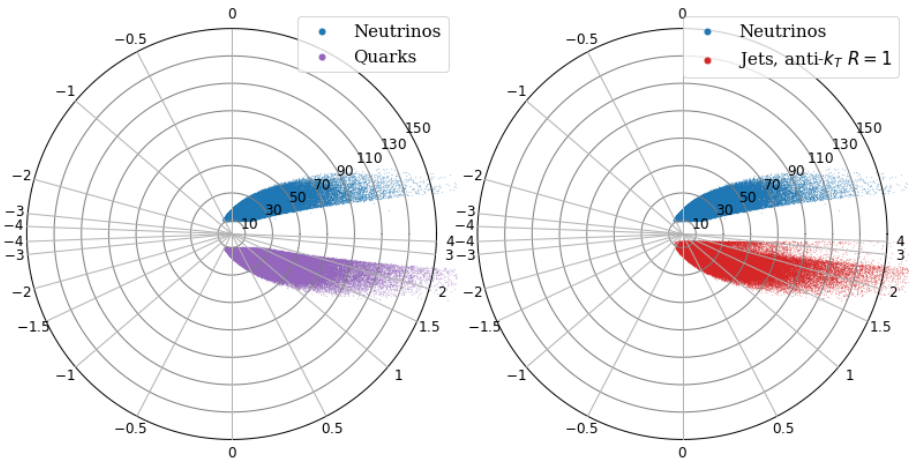

Simulations

- Pythia for event generation
- Detector readout simulated in Delphes
- Particle-flow algorithm used for reconstructing particles in event.
- Jets reconstructed using anti- k_T algorithm with $R = 1$, separately for particle-flow recon, and generated final-state particles.

Jets as a proxy for quarks

10+275 GeV, $0.1 < y < 0.85$, $p_T^\nu > 10$ GeV

Expected cross-sections and ability to probe high x_B

- Jet and ν cross-sections match as a function of transverse momentum.
- Large Björken x can be probed at large transverse momentum, complementing fixed-target experiments

Simulated event display

- Neutrino momentum can be inferred from missing momentum in event.

Observables in this study

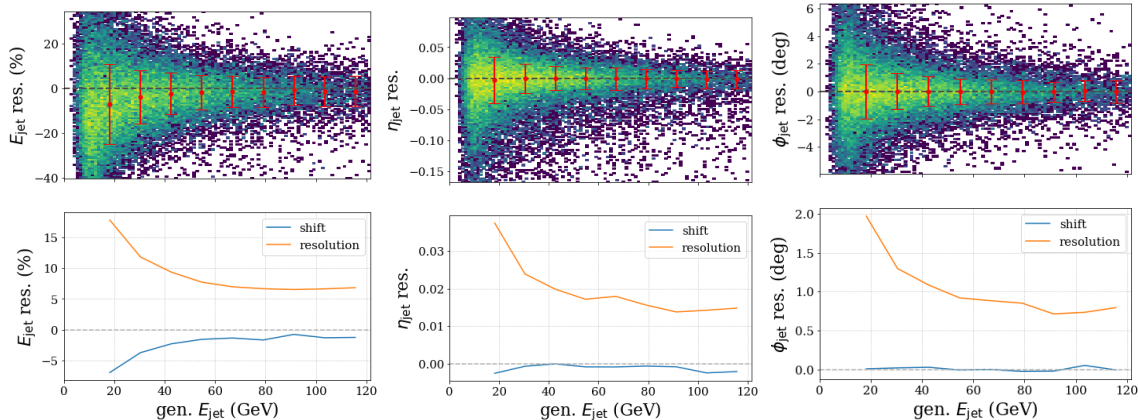

Azimuthal asymmetries can be measured with respect to

- correlation between proton spin and jet ($\phi_s - \phi_{\text{jet}}$), which can be measured in intervals of $\phi_\nu - \phi_{\text{jet}}$ (lepton-jet Sivers asymmetry)
- transverse p polarization: $\phi_s - \phi_h$ (Collins asymmetry) for hadrons in jet

Jet reconstruction performance: Energy, ϕ , η resolutions

- Jets reconstructed with anti k_T algorithm and $R = 1.0$
- For a 40 GeV jet, $\Delta E_{\text{jet}}/E_{\text{jet}} \approx 10\%$, $\Delta\eta_{\text{jet}} \approx 0.02$ and $\Delta\phi_{\text{jet}} \approx 1.1^\circ$

Lepton kinematics reconstruction

- lepton kinematics estimated using the Jacquet-Blondel method [2].
- Event-inelasticity:
$$y_{JB} = \sum_{\text{recon}} E_i - p_{z,i} / (2E_e)$$
- four momentum transfer:
$$Q_{JB}^2 = (p_T^{\text{miss}})^2 / (1 - y_{JB})$$
- Björken scaling variable:
$$x_{JB} = Q_{JB}^2 / (sy_{JB})$$

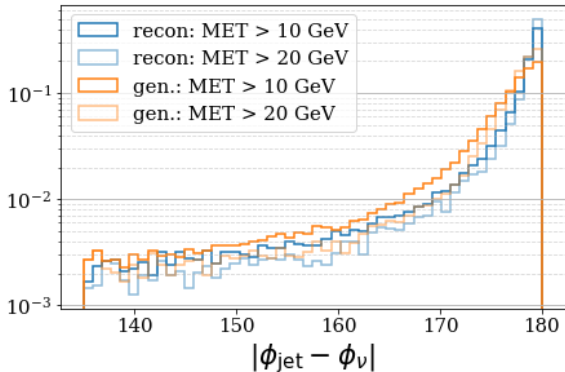

Resolution: q_T/p_T^ν

- $q_T = |\vec{p}_T^\nu + \vec{p}_T^{\text{jet}}|$ can be used as proxy for the struck quark's initial momentum
- q_T/p_T^ν is dimensionless; can be used to compare our CC results from EIC with other experiments at other energy scales.
- the resolution on q_T/p_T^ν is sufficient for binning with over 50% purity in 4 bins.

Lepton-jet asymmetry

- Jets tend to be produced back-to-back with the ν , as expected from conservation of momentum
- The $|\phi_{\text{jet}} - \phi_{\nu}|$ spectrum can be measured to probe TMD PDFs.
- Alternatively $|\phi_{\text{jet}} - \phi_{\nu}|$ can be used as a binning parameter for other measurements. (comparing jets in the peak vs the tail of this spectrum)

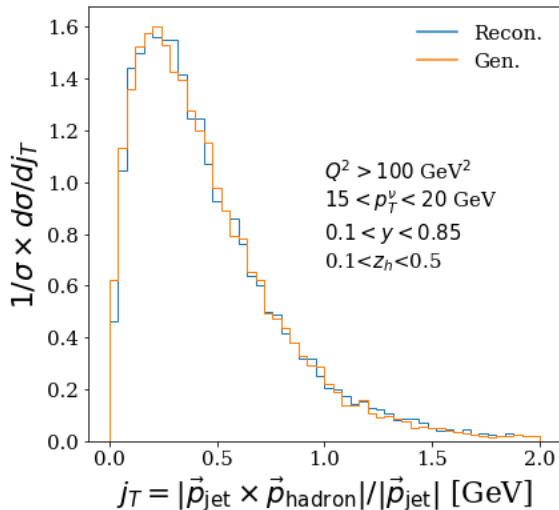

Hadron-in-jet kinematic variables z_h vs j_T

- z_h : fraction of momentum carried by hadron along jet axis
- j_T : hadron momentum transverse to jet

Hadron-in-jet kinematics: pion z_h vs j_T

Hadron-in-jet kinematics: pion η vs p

- charged pions' momenta can be measured up to ≈ 40 GeV.
- not surprisingly, z_h is correlated with hadron momentum.

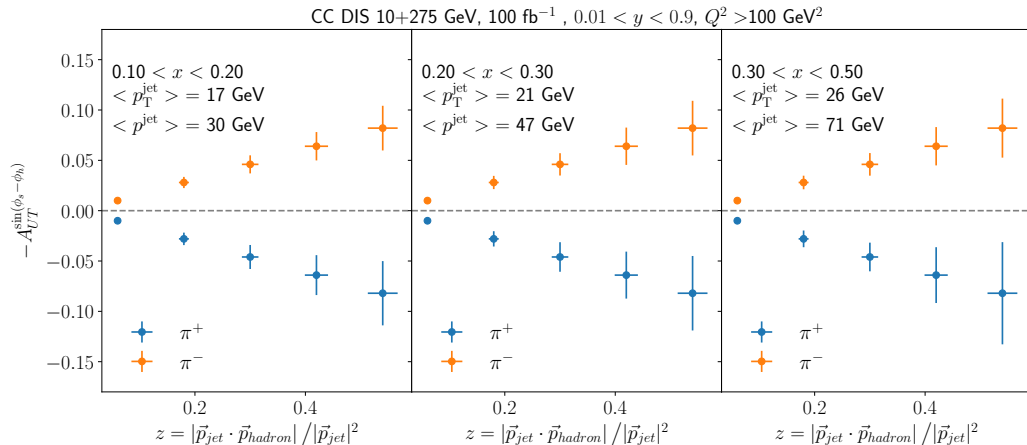

Expected statistical precision: Transverse polarization asymmetry

- Stat. uncertainties were projected for azimuthal asymmetries between the transverse proton polarization and the jets and/or hadrons in jets.
- $A_{UT} \equiv \frac{\sigma^+ - \sigma^-}{\sigma^+ + \sigma^-}$ is fit to $A_{UT}^{\sin \Delta \phi} \sin \Delta \phi$
- here, $\Delta \phi = \phi_S - \phi_{\text{jet}}$

*Central values estimated on NC DIS Liu et al. [3]

Expected statistical precision: Transverse polarization asymmetry (hadron in jets)

Conclusions

- Jets are an essential tool to study charged-current DIS.
- Jets can be reconstructed with reasonable resolution and efficiency using the EIC baseline detector.
- Charged-current DIS allows flavor selection of the struck quark, unlike neutral-current DIS.
- Lepton kinematics can be reconstructed with sufficient resolution for binning
- Sufficient statistical precision can be obtained to measure electron-jet and transverse-polarization vs hadron-in-jet asymmmetries.
