Planning ahead

- YR is almost done!
- 2021+ will be different
  - More full simulations
  - More complete analysis chains (reconstruction, tracking, analysis…)
  - Collaborations

What are you doing, and how? What do you foresee? What do you need?

Packages and Scheduling

- What are you using? And where (cvmfs, afs, local)?

- Are you using the queue? How much?

- Do you use just condor or eic-submit; what would you like?

- "root4eic?"

Storage

- How much storage do you/will you need?

- And how? Just mounting gpfs is probably not sustainable

- Are you making use of sharing via BNLbox?
  - We have another 1 TB available. Jerome suggests to mount it as an Amazon/S3 style storage – good for cloud, national lab collaboration, … Thoughts?

- Tape Storage?

Documentation

- I see many people still using outdated locations, broken .cshrc, wrong use of basic software… Suggestions for better visible documentation?
