June 16, 2021

Details:

- Particle: π^-
- Statistics: 100000 (0-30 GeV) + 50000 (0-10 GeV)
- η range: -4 to 4
- Cuts employed:
 - **Tower energy cut: 100 MeV**
 - Detector-wise η cuts
 - Circular cuts on $\Delta\phi$ and $\Delta\theta$: for manual clustering
- Photon digitization: turned off
- **Sampling fractions updated for all calorimeters**

Pion

**CEMC+HCALIN+HCALOUT
FEMC+FHCAL**

Normalization procedure:

1. Make Tprofile plots for the individual calorimeter's t_e/g_e vs g_e plot.
2. Fit it with a function and normalize this function.
3. Multiply this normalized function with the tower energy of the respective calorimeter.
4. Look at the summed tower energy $(t_e - g_e)/g_e$ plot (i.e. CEMC+HCALIN+HCALOUT & FEMC+FHCAL) and fit it with a function.
5. Use this function to recalibrate $t_e(\text{CEMC+HCAL})$ and $t_e(\text{FEMC+FHCAL})$.

Before recalibration: CEMC+HCALIN+HCALOUT

$\eta = -1.1$ to 1.1

$p0=0.11155$;
 $p1=0.431151$

Tprofile plots:

(pol4 fit)

$([0] + [1]/\sqrt{x}) + [2]/x$

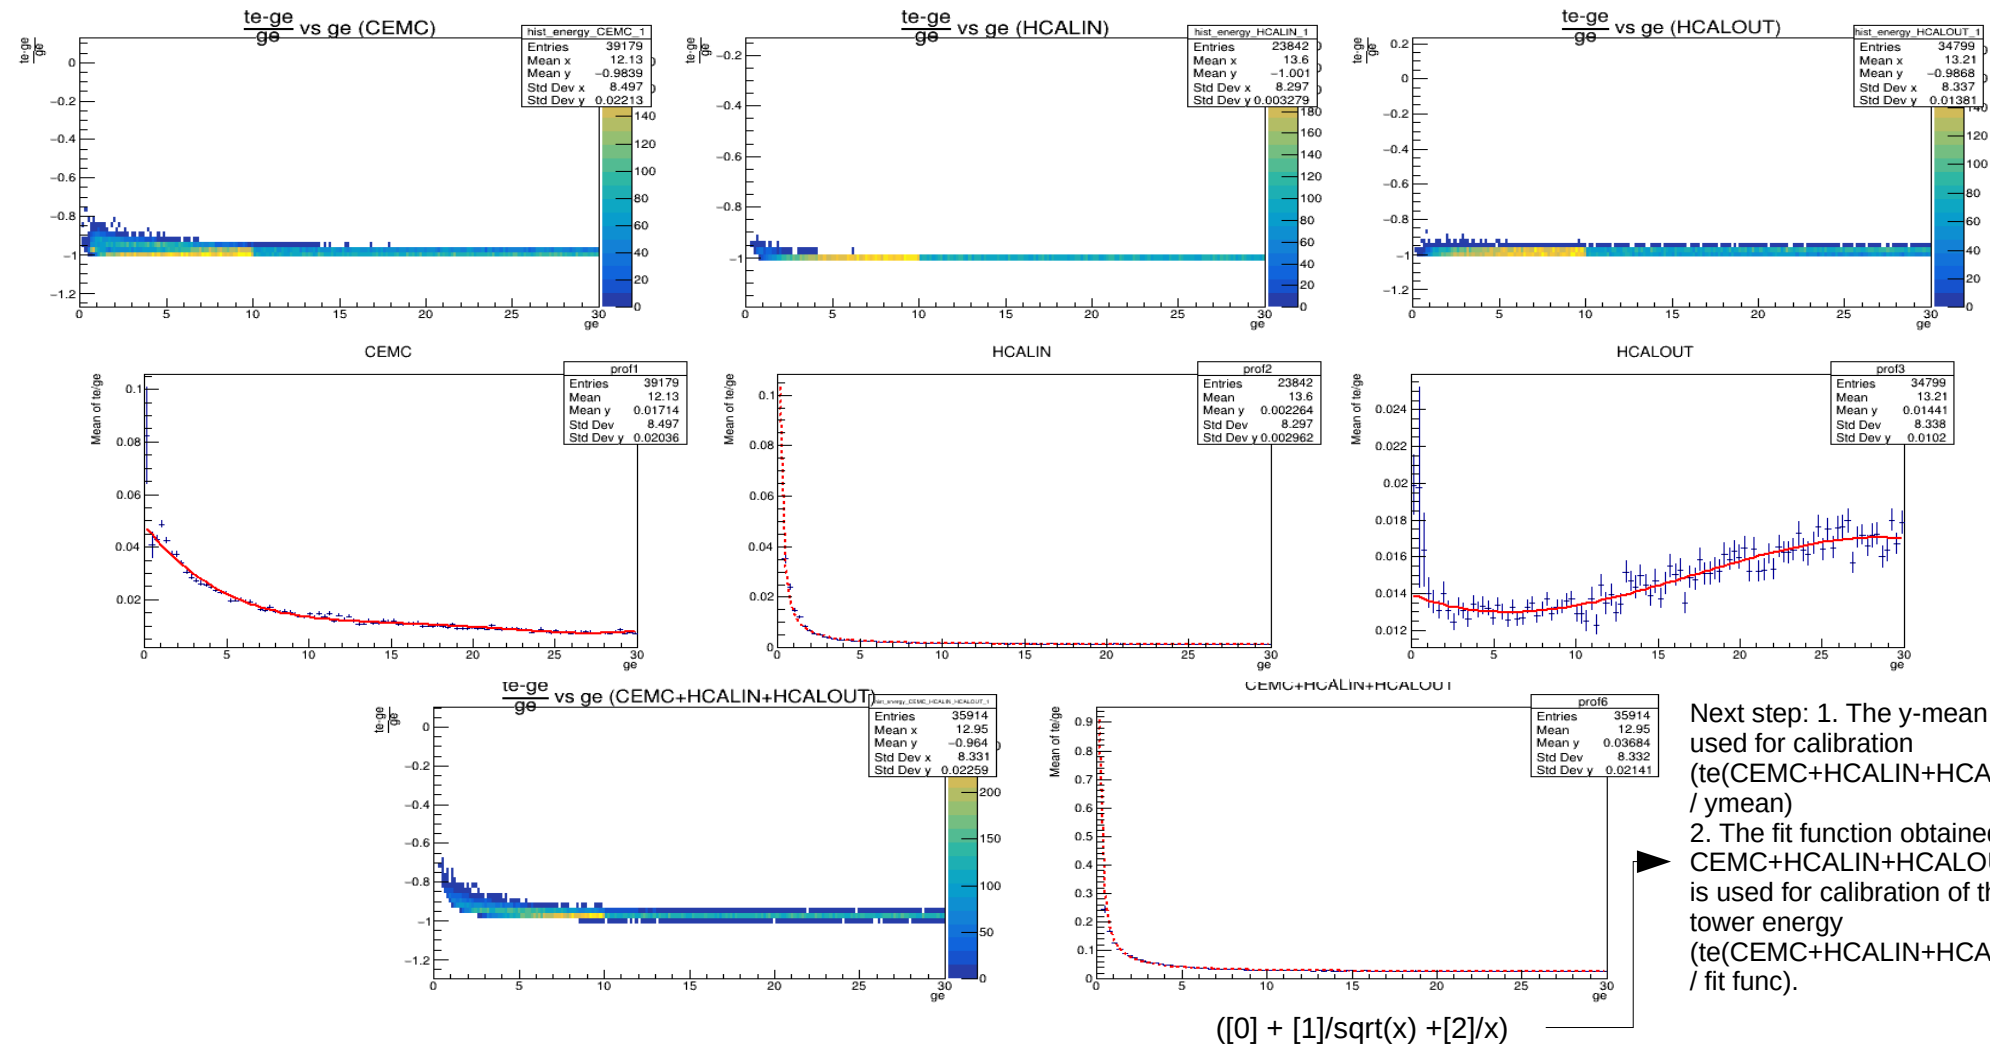

(pol3 fit)

Next step: Normalization of these three fit functions by dividing them with their integral.
The normalized function is then **multiplied** with the tower energy of the respective calorimeter.

Shape correction with normalized fit functions: CEMC+HCALIN+HCALOUT

$\eta = -1.1$ to 1.1

Recalibration: CEMC+HCALIN+HCALOUT

$\eta = -1.1$ to 1.1

Recalibration:- with y-mean

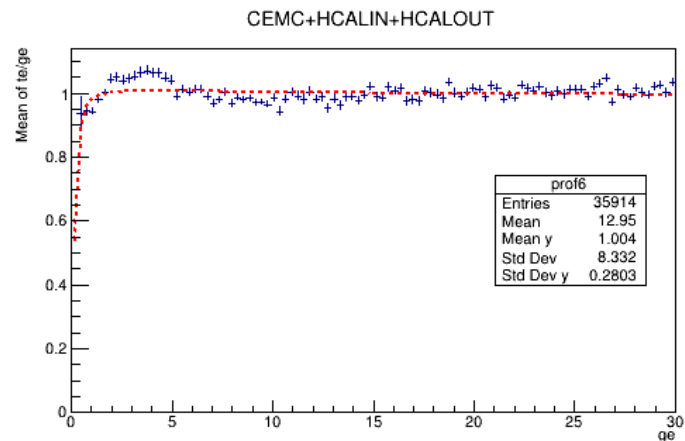

$p_0 = -0.0108495$; $p_1 = 0.706109$

Recalibration:- with fit function

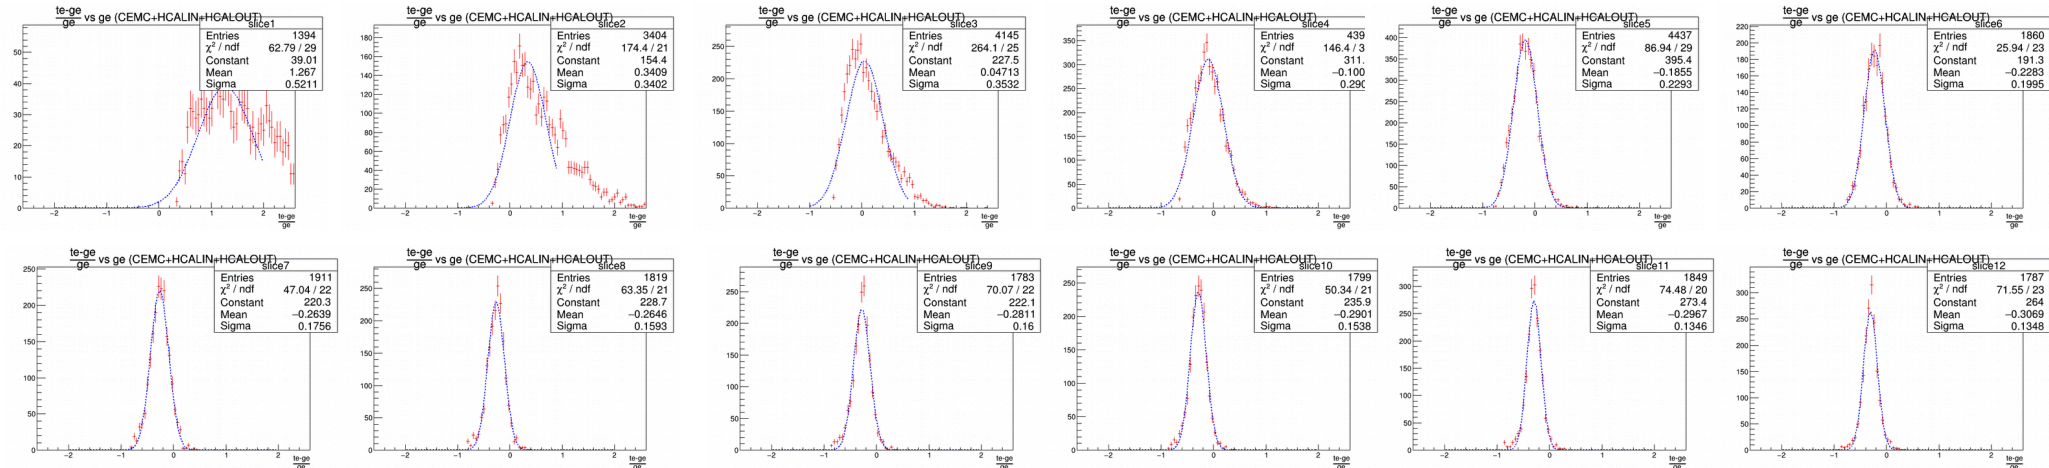

$p_0 = 0.0558756$; $p_1 = 0.669669$

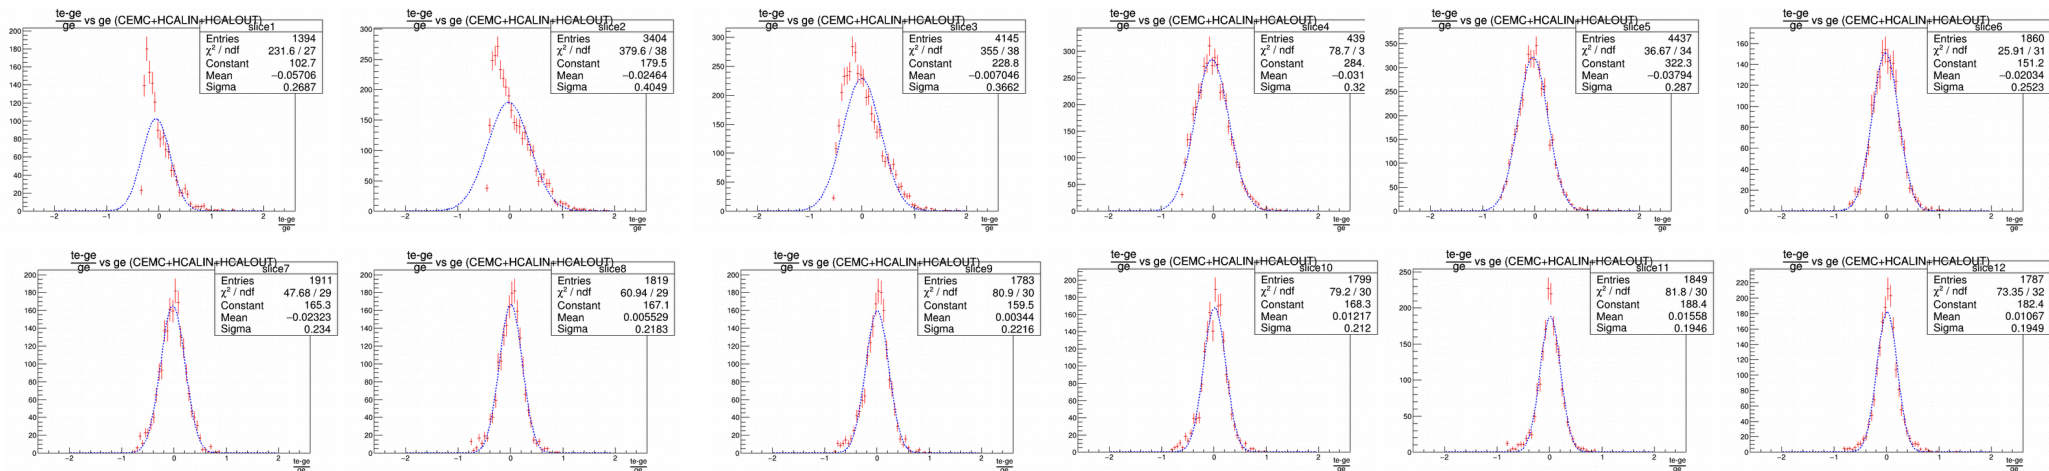

Gaussian Fits: CEMC+HICALIN+HICALOUT

$\eta = -1.1$ to 1.1

Recalibration:- with y-mean

Recalibration:- with fit function

Before recalibration: FEMC+FHICAL

$\eta = 1.3$ to 3.3

$p0=0.0598577$;
 $p1=0.316926$

Tprofile plots:

(pol3 fit)

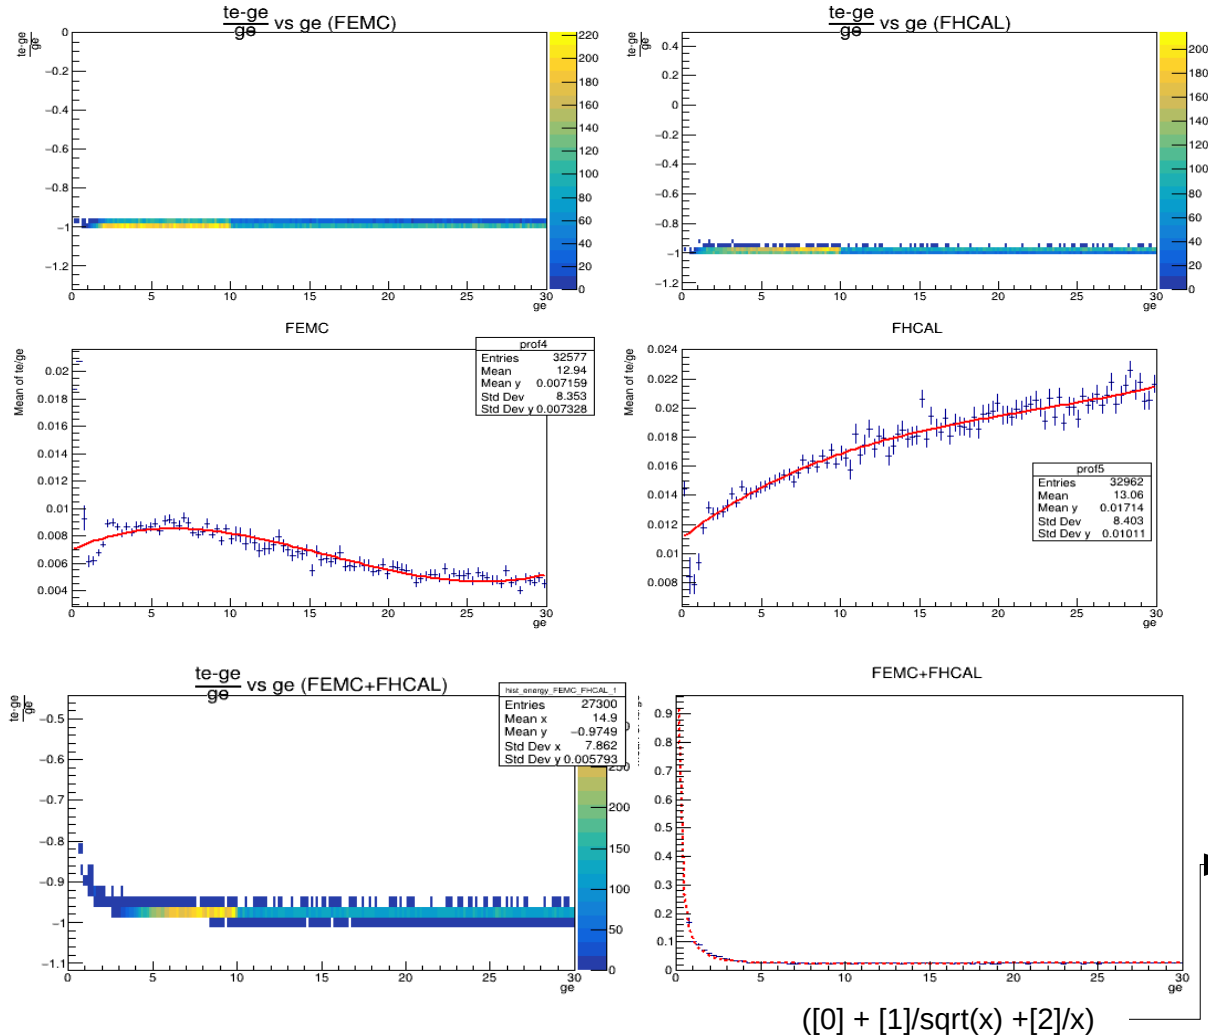

(pol3 fit)

Next step: Normalization of these two fit functions by dividing them with their integral.
The normalized function is then **multiplied** with the tower energy of the respective calorimeter.

Shape correction with normalized functions: FEMC+FHCAL

$\eta = 1.3$ to 3.3

Next step: 1. The y-mean is used for calibration ($te(FEMC+FHCAL)/y_{mean}$)
 2. The fit function obtained for FEMC+FHCAL plot is used for calibration of the total tower energy ($te(FEMC+FHCAL)/fit\ func$).

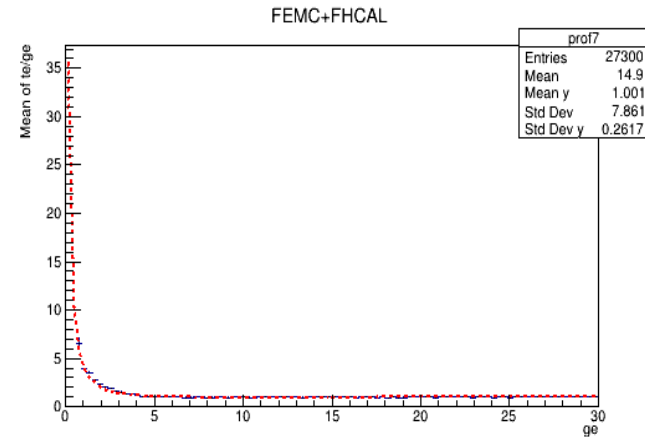

Recalibration: FEMC+FHCAI

$\eta = 1.3$ to 3.3

Recalibration:- with y-mean

$p_0=0.222486$; $p_1=-0.111601$

Recalibration:- with fit function

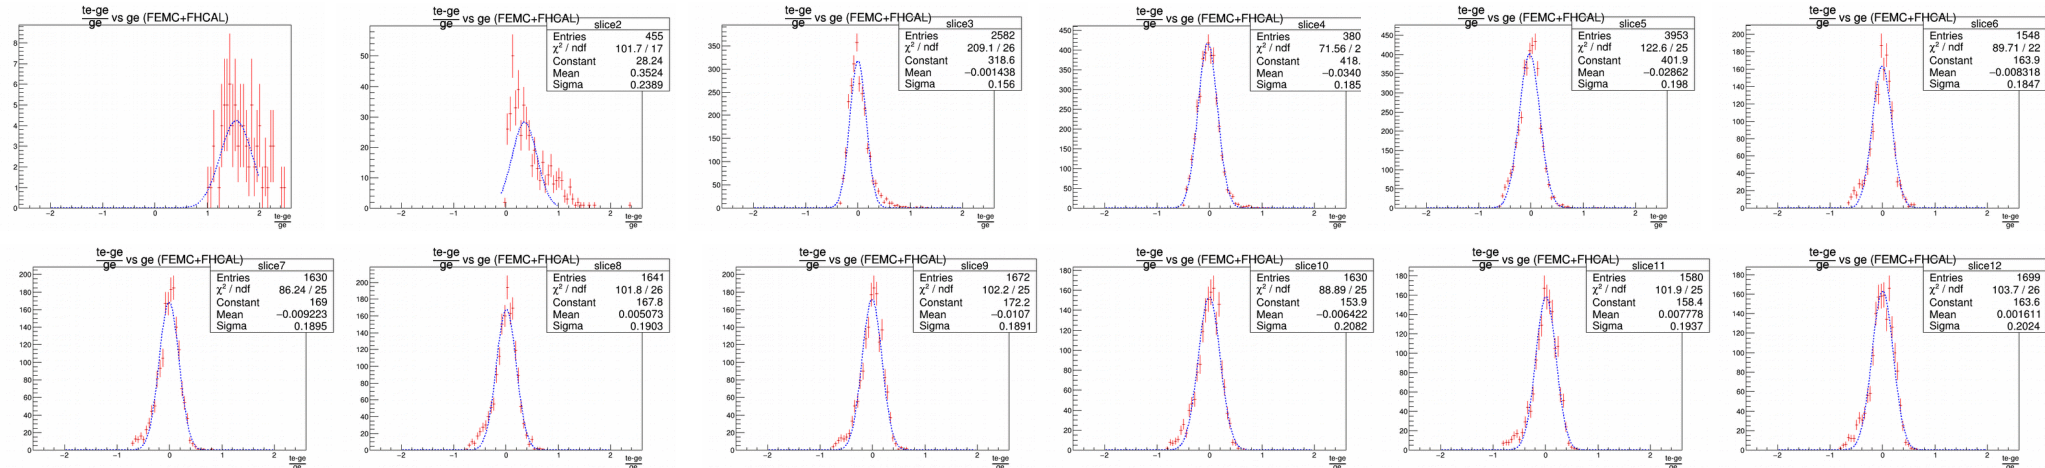

$p_0=0.230483$; $p_1=-0.130824$

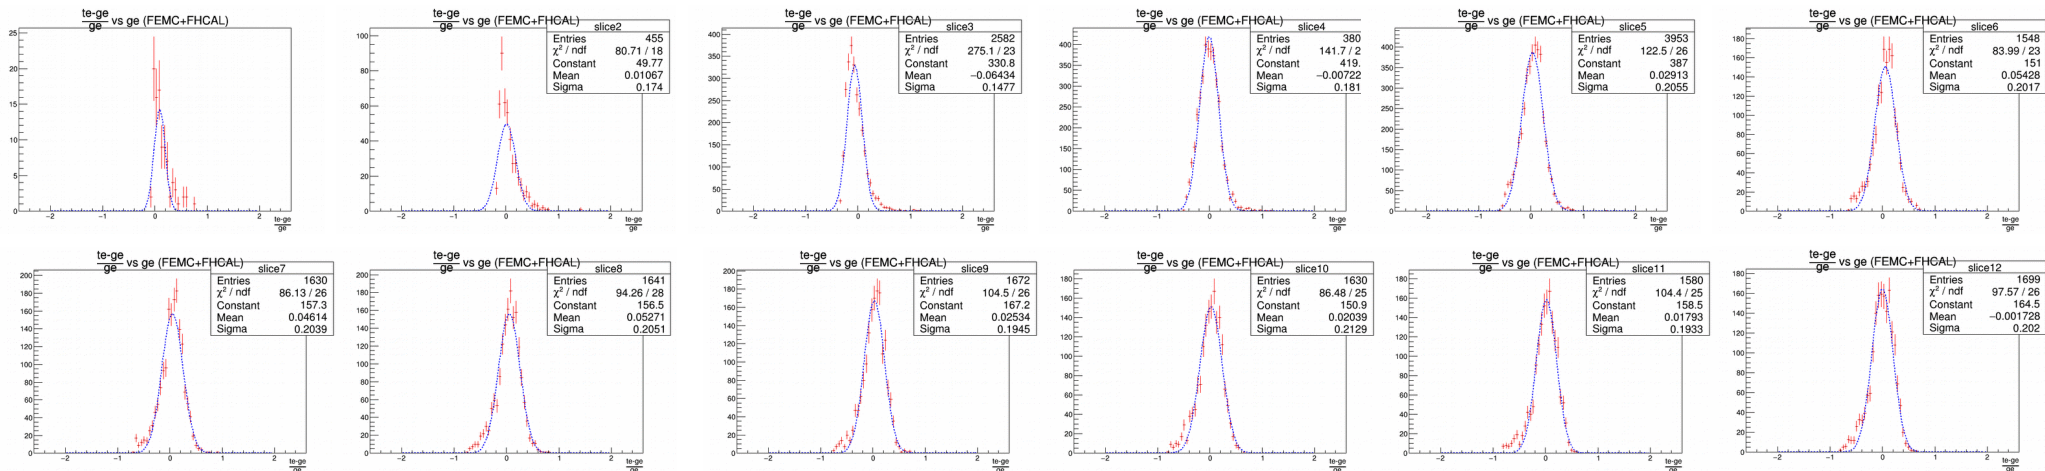

Gaussian Fits: FEMC+FHCal

$\eta = 1.3$ to 3.3

Recalibration:- with y-mean

Recalibration:- with fit function

THE END
