

Fun4All Calorimeter Plots: Implementation of MIP energy cut on pion plots

Simran
Lokesh Kumar
Panjab University, Chandigarh, INDIA

Fun4All QA Biweekly Meeting
December 10, 2021

Contents:

- Implementation of theta-dependent energy cut on:
 - Monoenergetic pions: energy deposition plots
 - 0-30 GeV pions: energy resolution plots

Specifications:

SIMULATION & ANALYSIS DETAILS FOR MUON:

- Particles: mu-
- Given energy (ge): 4 GeV
- Events: 46900 (mu-) (By IITI)
- **NEW** pseudorapidity cuts on calorimeters:
 - EEMC: $\eta = -3.4$ to -1.77
 - CEMC, HCALIN, HCALOUT: $\eta = -0.98$ to 0.99
 - FEMC, FHCAL: $\eta = 1.32$ to 3.14
- A theta dependent energy cut obtained from energy deposition plots of electromagnetic calorimeters

SIMULATION & ANALYSIS DETAILS FOR PION:

- Particles: pi-
- 1. Events: 42300 (By IITI)
- 2. Events: 100000 (0-30 GeV), 50000(0-10GeV)
- **NEW** pseudorapidity cuts on calorimeters:
 - EEMC: $\eta = -3.4$ to -1.77
 - CEMC, HCALIN, HCALOUT: $\eta = -0.98$ to 0.99
 - FEMC, FHCAL: $\eta = 1.32$ to 3.14
- The theta dependent energy cut obtained from muons implemented on the emcals and energy resolution compared with previous results.

CEMC:

Mean of te_{agg} vs $gtheta$ (CEMC)

Without theta dependent cut:

($\eta = -1.1$ to 1.1)

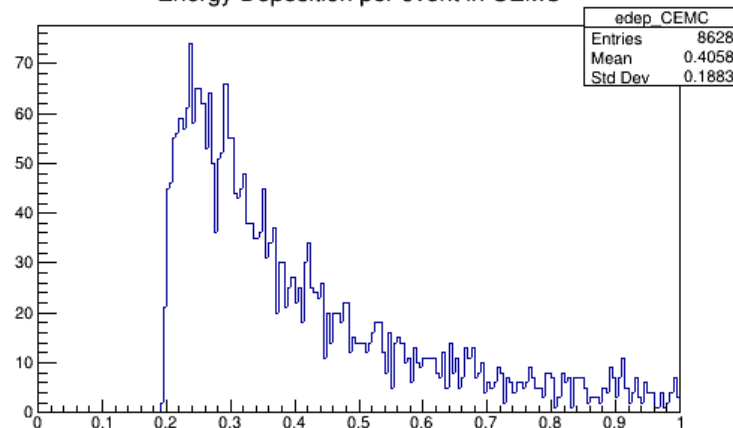

Energy Deposition per event in CEMC

With theta dependent cut:

($\eta = -0.98$ to 0.99)

Energy Deposition per event in CEMC

FEMC:

Mean of te_{agg} vs $gtheta$ (FEMC)

Without theta dependent cut:
($\eta = 1.3$ to 3.3)

Energy Deposition per event in FEMC

With theta dependent cut:
($\eta = 1.32$ to 3.14)

Energy Deposition per event in FEMC

EEMC:

Mean of te_{agg} vs $gtheta$ (EEMC)

Without theta dependent cut:
($\eta = -3.5$ to -1.7)

Energy Deposition per event in EEMC

With theta dependent cut:
($\eta = -3.4$ to -1.77)

Energy Deposition per event in EEMC

Theta dependent energy cut implemented on pion: Barrel Resolution (CEMC+HCALIN+HCALOUT)

σ_E/E vs ge (CEMC+HCALIN+HCALOUT)

$$\sigma_E/E = 18.1\% + 27.3\%/ \sqrt{E}$$

Previous case:

Individual tower energy cut on CEMC: 200 MeV (To remove the calibration problem faced in higher energies)

+

Agg tower energy cut on CEMC: 0 (to remove zeroes)

Latest result:

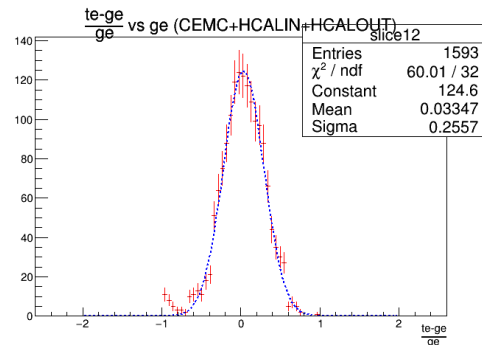

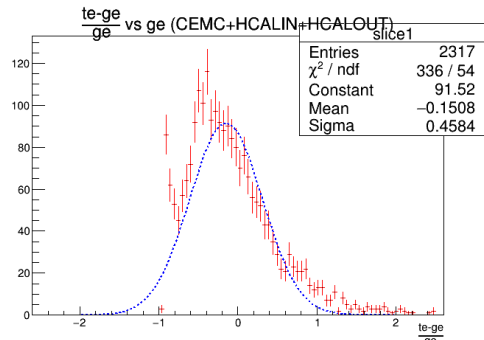

Individual tower energy cut on CEMC: 200 MeV

+

Agg tower energy cut on CEMC: Theta dependent energy cut obtained from muon energy parameterization

(100MeV agg te cuts on other calorimeters)(unchanged)

CEMC+HCALIN+HCALOUT: Gaussian fits

CEMC+HCALIN+HCALOUT: gaussian fits

Theta dependent energy cut implemented on pion: Forward Resolution (FEMC+FHCAL)

σ_E/E vs ge (FEMC+FHCAL)

$$\sigma_E/E = 3.4\% + 50\%/ \sqrt{E}$$

Previous case:

Individual tower energy cut on FEMC:
No cut
(This cut only worsens the resolution)
+
Agg tower energy cut on FEMC: 200 MeV

Latest result:

Agg tower energy cut on FEMC:
Theta dependent energy cut obtained
from muon energy parameterization

(100MeV agg te cuts on other
calorimeter)(unchanged)

FEMC+FHGAL: Gaussian fits

FEMC+FHGAL: gaussian fits

THE END
