

Some template figures for SIDIS

- Currently only about 1k events available from test production
- Using g4tracking_eval and true PID
- All using the electron DIS reconstruction method for now
- Default DIS cuts ($Q^2 > 1 \text{ GeV}^2$, $W^2 > 10 \text{ GeV}^2$, $0.01 < y < 0.95$)
- Other SIDIS variables (ϕ_s, ϕ_h) also available

YR figure 8.29, using g4tracking_eval

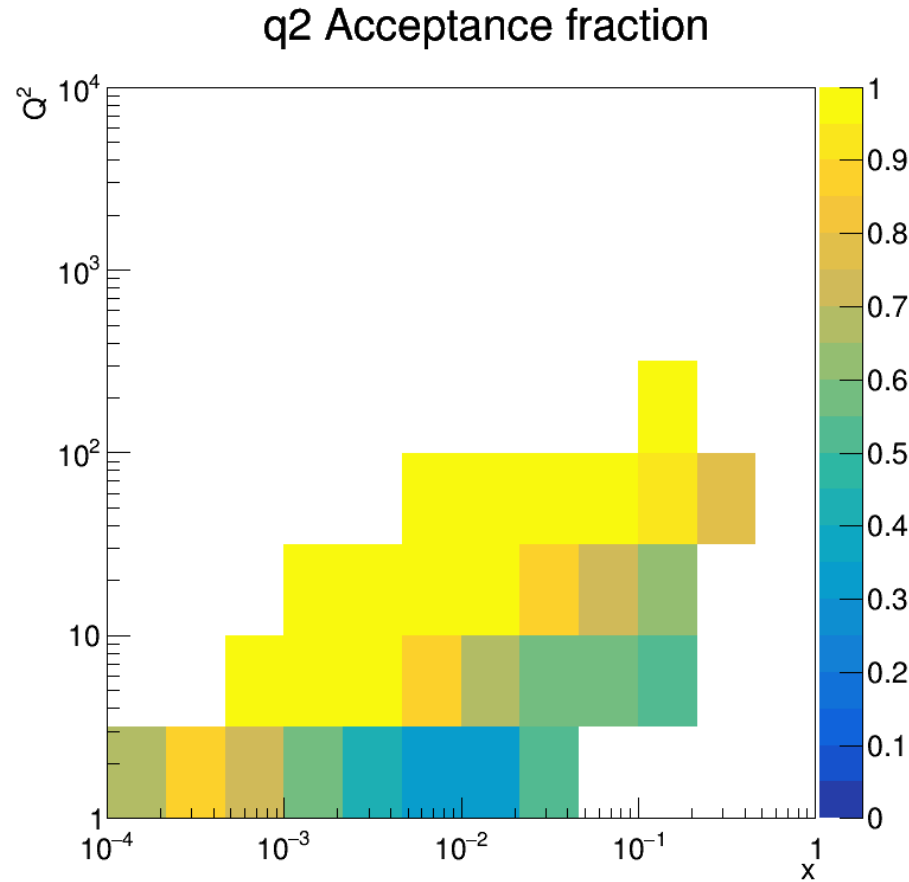

Simple avg bin deviations in x/Q^2 binning

Large deviations of DIS kinematics at low y where electron method has difficulties \rightarrow try to improve with JB/double angle/mixed methods

Acceptance fraction

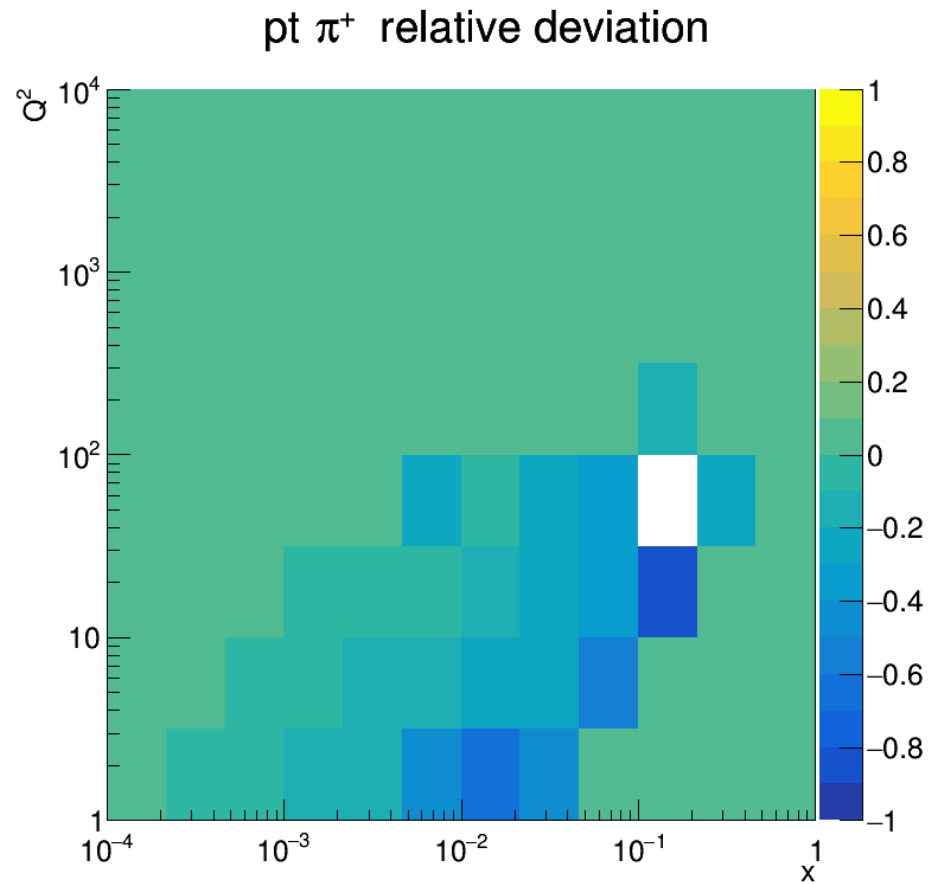

Fraction of reco events reconstructed (in true x/Q^2 bins)

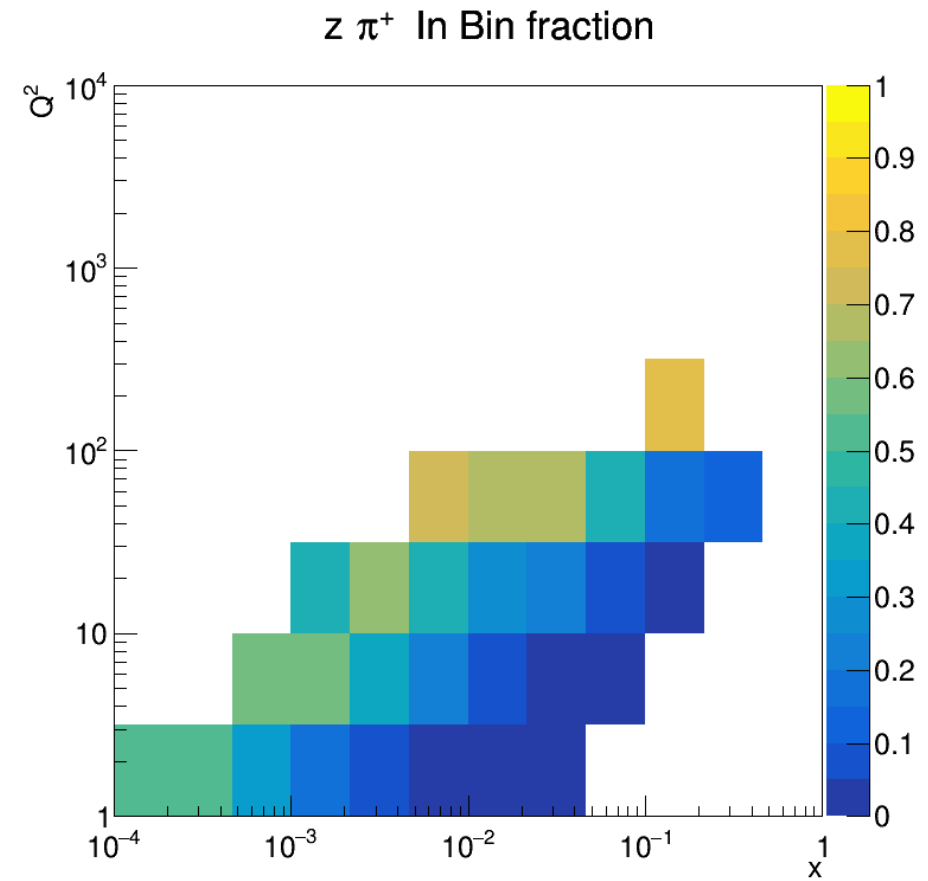

Fraction of reco events remaining in true x/Q^2 bins with correct bin assignment

relative P_T , z deviation

Also largest z smearing at low y due to DIS kinematics

Correct bin Acceptance fractions

Simple SIDIS resolutions in one x/Q^2 bin vs z
