# Generalized form factors contributions to structure functions

$$\frac{d\sigma_L}{dt} = \frac{4\pi\alpha}{k} \frac{1}{Q^2} \left\{ (1 - \xi^2) |\langle \tilde{H} \rangle|^2 - 2\xi^2 \text{Re} [\langle \tilde{H} \rangle^* \langle \tilde{E} \rangle] - \frac{t'}{4m^2} \xi^2 |\langle \tilde{E} \rangle|^2 \right\}$$

$$\frac{d\sigma_T}{dt} = \frac{4\pi\alpha}{2kQ^4} \left[ (1 - \xi^2) |\langle H_T \rangle|^2 - \frac{t'}{8m^2} |\langle \bar{E}_T \rangle|^2 \right]$$

$$\frac{d\sigma_{LT}}{dt} = \frac{4\pi\alpha}{\sqrt{2}kQ^3} \xi \sqrt{1 - \xi^2} \frac{\sqrt{-t'}}{2m} \text{Re} [\langle H_T \rangle^* \langle \tilde{E} \rangle]$$

$$\frac{d\sigma_{TT}}{dt} = \frac{4\pi\alpha}{kQ^4} \frac{t'}{16m^2} |\langle \bar{E}_T \rangle|^2$$

---

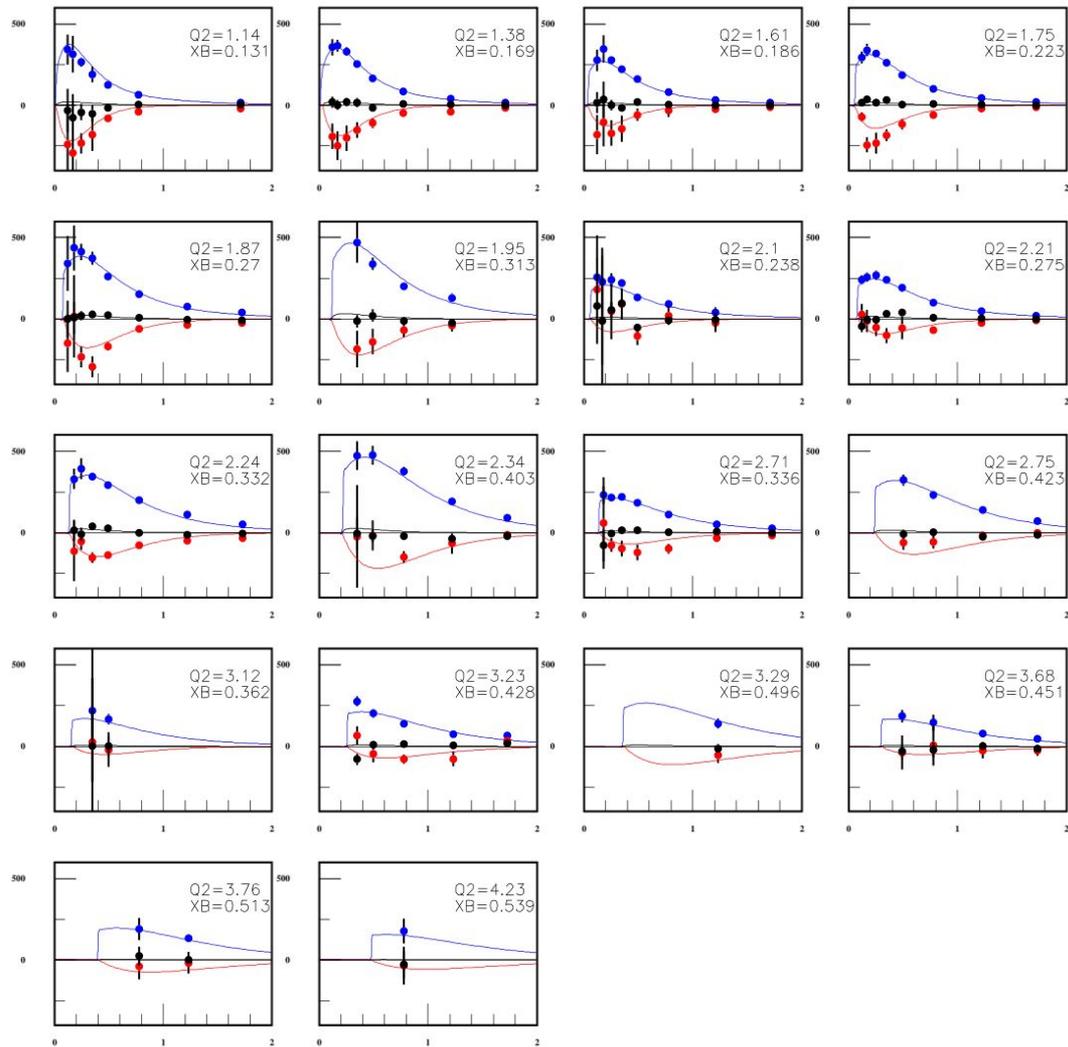

## Parameterizations of the generalized form factors

There are 8 parameters used in the model for the  $\langle H_T \rangle$  and  $\langle \bar{E}_T \rangle$  Generalized form factors in the model:

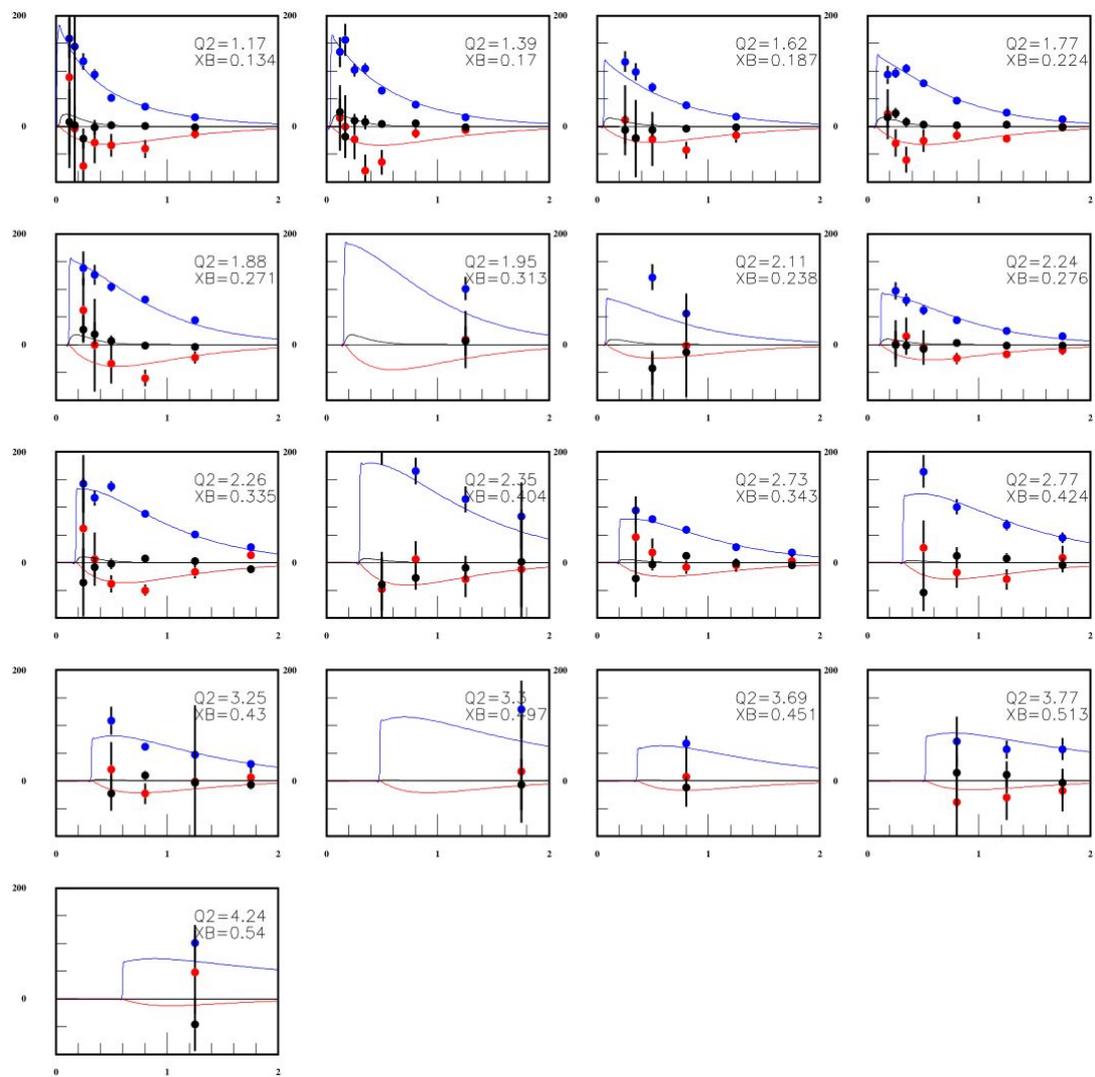

$$\langle H_T \rangle(t, x_B, Q^2) = p_1 \cdot \exp[p_2 + p_3(\ln x_B - \ln 0.15)t] \cdot Q^{p_4} \quad (14)$$

$$\langle \bar{E}_T \rangle(t, x_B, Q^2) = p_6 \cdot \exp[p_7 + p_8(\ln x_B - \ln 0.15)t] \cdot Q^{p_9} \quad (15)$$

- Comparison of parameterizations with  $\pi^0$  structure function measurements

- Comparison of parameterizations with **eta** structure function measurements

# Github repository

git clone [https://github.com/JeffersonLab/aao\\_gen.git](https://github.com/JeffersonLab/aao_gen.git)

**Example usage to generate 1000 events with minimum xB 0.1 and minimum W2 of 3:**

---

```
python3 aao_gen.py --xBmin 0.1 --w2min 3 --trig 1000
```

**output datafile is in aao\_gen.dat**

---

**To get command line options: ./aao\_gen.py -h**

---

optional arguments:

```
-h, --help            show this help message and exit
--rad                 Uses radiative generator instead of nonradiative one,
                     CURRENTLY NOT WORKING (default: False)
--physics_model PHYSICS_MODEL
                     Physics model: 1=A0, 4=MAID98, 5=MAID2000 (default: 5)
--flag_ehel FLAG_EHEL
                     0= no polarized electron, 1=polarized electron
                     (default: 1)
--npart NPART        number of particles in BOS banks: 2=(e-,h+),
                     3=(e-,h+,h0) (default: 3)
--spin FBTYPE        final state helicity: 1=pi0, 2=pi+ (default: 1)
```

# Plans

- Finish a wrapper to adopt this generator for EIC purposes (head-on collision)
- Convert from LUND to HepMC format (Jin's afterburner? Beam crossing?)
- Start working with fun4all software:
  - Based on Yellow Report, DVMP yield is expected to be small for low  $x_B$  region

**Figure 8.64:** Ratio of DVMP  $\pi^0$  to DVCS event yields in phase-space of  $(x_B, Q^2)$  for 5 GeV  $\times$  41 GeV beam energies. For more details see the text.
