

# Update: towards full reconstruction and physics benchmarks

Miguel Arratia (UCR),  
June 15th 2021  
(T-169 days)

**ATHENA** simulation  
Pythia8 + Geant4

### Reminder:

- We have “overspec” granularity in simulation.
- We will “regroup” layers/cells in the reconstruction step to study tradeoff granularity

# Simulation status: single-particle G4 simulations

Pion 20 GeV

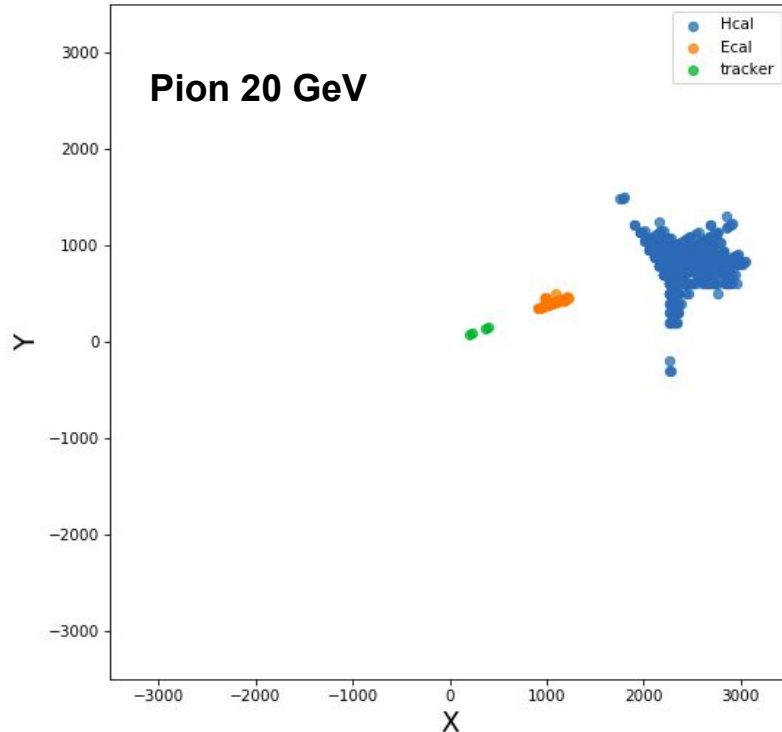

Pion 20 GeV, (showers in ECAL)

“Hits” from tracker, ECAL, and HCAL are shown here

# Current status: debugging HCal reconstruction code

- We are still testing output of HCal reconstruction code.
- Updates were required given that it is not uncommon to have HCAL clusters that encompass more than one sector. Chao made improvements, I am about to test this.
- Working in flexible codes for the “merging” of HCAL layers for granularity studies

# ATHENA simulation

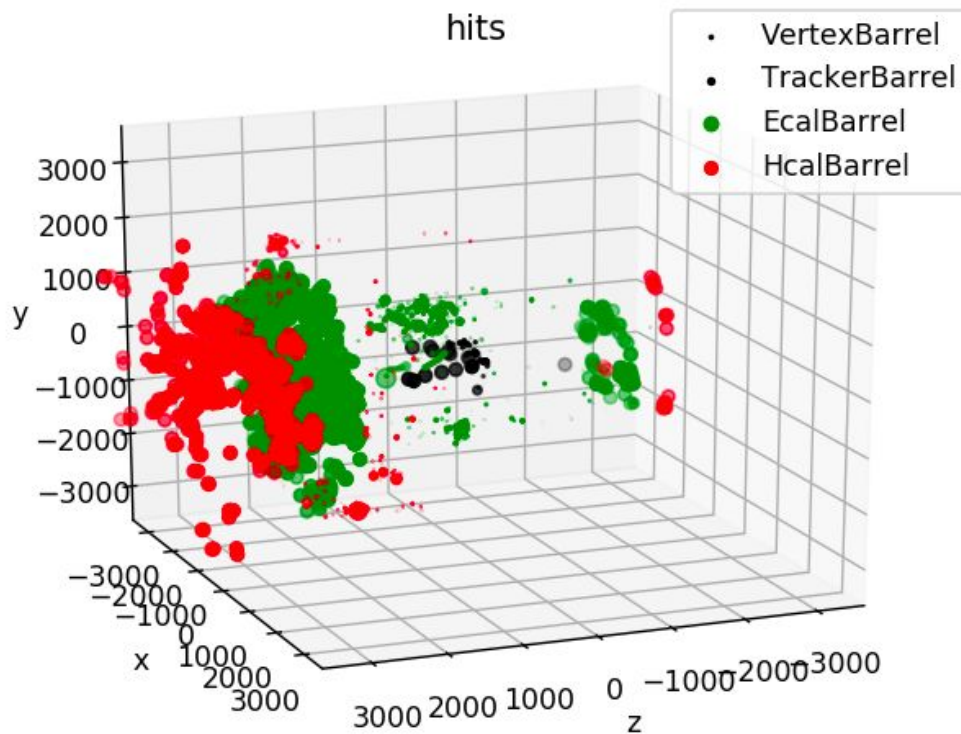

## Pythia8 + Geant4

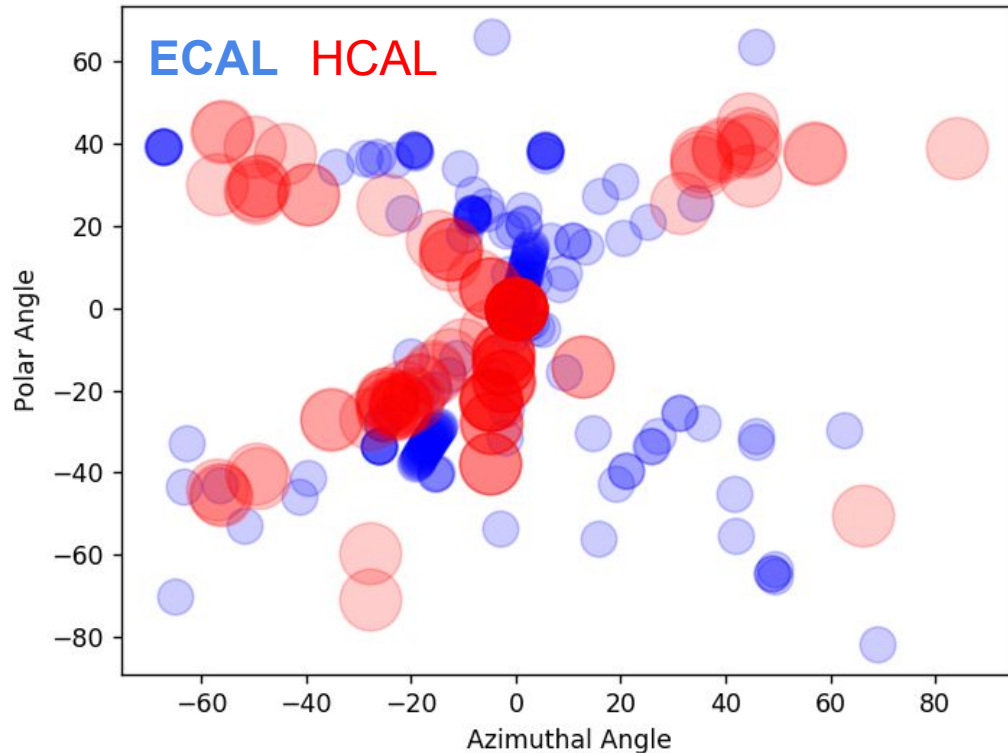

- First full-simulation campaign successfully ran last week (Wouter) using Pythia8 DIS events (Brian)
- Useful test to stress computer resources, estimate data sample sizes, and start physics analysis!

**A milestone!**

# Full simulation files: G4 sim done, reconstruction ongoing

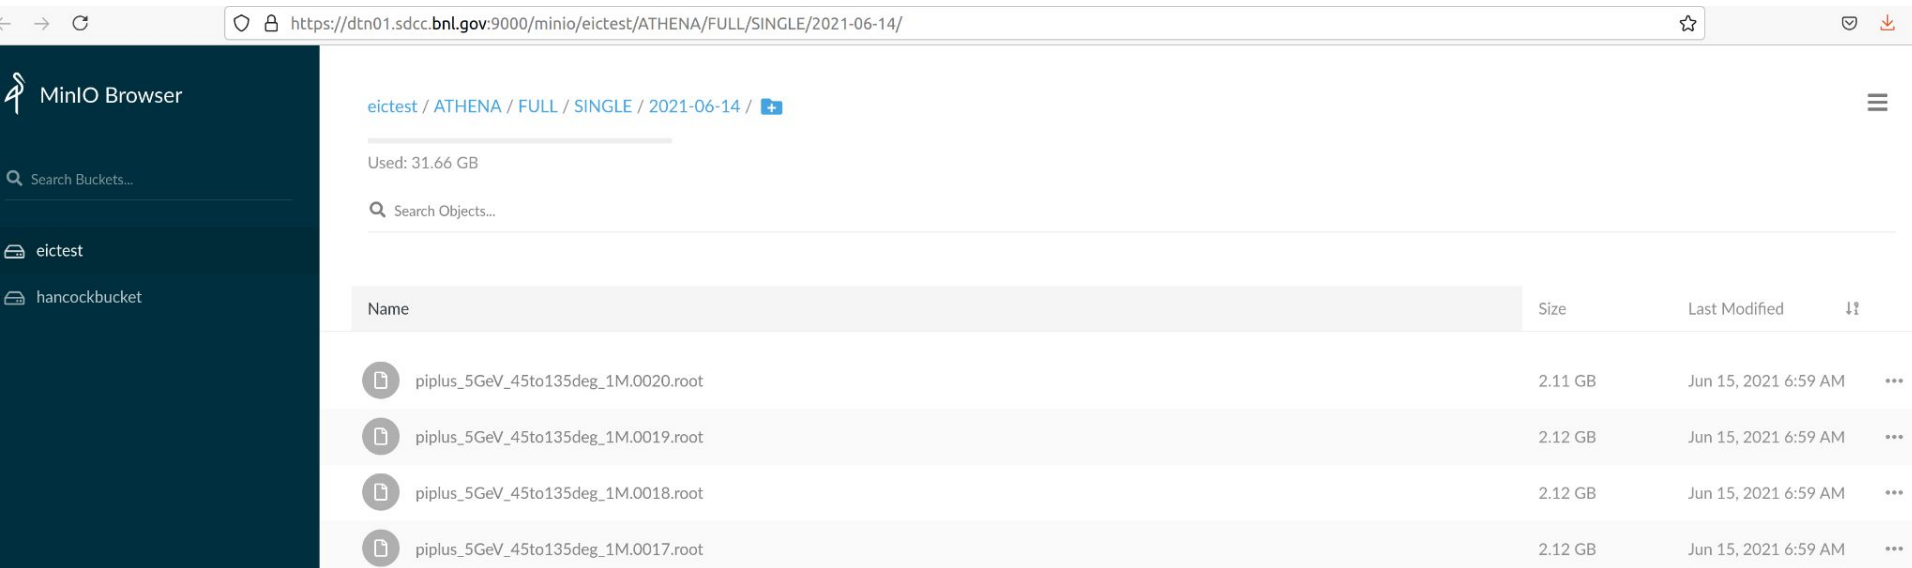

# Pythia8 DIS event ( $Q^2 > 100 \text{ GeV}^2$ ), in barrel

## Reminder:

We want to combine  
tracker+ECAL + HCAL  
energy (“energy-flow”  
algorithm)

# Getting some simulation files to get started is easy:

The screenshot displays the MinIO Browser interface. The browser's address bar shows the URL: `https://dtn01.sdcc.bnl.gov:9000/minio/eicctest/ATHENA/FULL/SINGLE/2021-06-14/`. The interface includes a dark sidebar on the left with the MinIO logo and the text "MinIO Browser". Below the sidebar, there are search fields for "Search Buckets..." and "Search Objects...". The main content area shows a breadcrumb path: `eicctest / ATHENA / FULL / SINGLE / 2021-06-14 /`. A progress bar indicates "Used: 31.66 GB". Below this, a table lists simulation files with columns for Name, Size, Last Modified, and a menu icon.

| Name   | Size    | Last Modified        |     |
|--|---------|----------------------|-----|
|  <code>piplus_5GeV_45to135deg_1M.0020.root</code> | 2.11 GB | Jun 15, 2021 6:59 AM | ... |
|  <code>piplus_5GeV_45to135deg_1M.0019.root</code> | 2.12 GB | Jun 15, 2021 6:59 AM | ... |
|  <code>piplus_5GeV_45to135deg_1M.0018.root</code> | 2.12 GB | Jun 15, 2021 6:59 AM | ... |
|  <code>piplus_5GeV_45to135deg_1M.0017.root</code> | 2.12 GB | Jun 15, 2021 6:59 AM | ... |

# How you could explore the simulation:

(for example: <https://github.com/miguelignacio/calostudies> )

```
In [1]: %matplotlib notebook
import uproot as ur
import matplotlib.pyplot as plt
import k3d
import numpy as np
import awkward as ak
```

## Get file and TTree, print branches, convert to array

```
In [2]: #file = ur.open('sim_highq2.root')
file = ur.open('klong_10GeV_45to135deg_1M.0001.root')
tree = file['events']
print(tree.keys())
ak_arrays = tree.arrays()
```

```

# “Particle-gun” KL. 2 events shown below

- Beware, “single particle” events contain electron and proton as well.
- Should we change this behaviour for simplicity?

# Summary

- HCAL fully integrated in DD4HEP simulations.
- Both single-particle and Pythia8 DIS events are already available.  
G4 simulation step done, reconstruction ongoing.
- Once we fix clustering code, we will proceed to perform physics benchmark analyzes.
