Download the Minio client:

```
wget https://dl.min.io/client/mc/release/linux-amd64/mc
```

Register your S3 instance:

```
./mc config host add S3 https://dtn01.sdcc.bnl.gov:9000 $u $p
```

Copy files (recursively):

```
./mc cp -r S3/eictest/ATHENA/RECO/SINGLE/neutron/2021-06-17 .

Direct Access to Files on S3 or XRootD

- Direct access: `TFile* file = TFile::Open("s3https://dtn01.sdcc.bnl.gov:9000/eic/test/ATHENA/RECO/JETS/crossDivNrgCrab/DIS_NC_Q2gt10_crossDivNrgCrab_25mRad_18x275_v1.0001.root", "AUTH=eicS3read:eicS3read")` or use `export S3_ACCESS_KEY=eicS3read S3_SECRET_KEY=eicS3read`
- Using xrootd on the copy mirrored at JLab: `TFile* file = TFile::Open("root://sci-xrootd.jlab.org//osgpool/eic/ATHENA/RECO/JETS/crossDivNrgCrab/DIS_NC_Q2gt10_crossDivNrgCrab_25mRad_18x275_v1.0001.root")` (no authentication needed; public access)

This avoids the need for large data transfers.

Computing Update

Large scale data productions

- Input: HepMC files preferred (`pip install mcconv` for other formats)
- Full simulation with current detector model, all bells and whistles:
 - Typical: 0.25 to 3.0 s/event, <500MB RAM RSS, 30 kB to 750 kB output size/event
 - Slightly decreasing performance as geometry features are added
 - Full ROOT files on S3 under [ATHENA/FULL/](#)
- Reconstruction
 - Focus on full calorimetry clustering (Ecal and Hcal), tracking will be added next
 - Reco ROOT files on S3 under [ATHENA/RECO/](#)
- Full simulation: ~weekly repetition; reconstruction: every few days
- Written to work on any slurm batch system; performed at Compute Canada
 - Currently also working on trial runs on OSG at the ~2k job scale for single particle events)

Overview of Available Productions
