Tools and Services Activity Summary

Overleaf
- Web portal for users being created. Expect licenses to be available to users this month, and an announcement to Physics and CSI will be made soon.

DocDB
- Provisioning a DocDB instance at the SDCC for sPHENIX. Will contact sPHENIX to test in the coming days.

Digital Repositories
- InvenioRDM V5 release delayed. LTS release (expected for July 29) will not include the communities module (ETA is now October 2021).

General Web Services
- Working with Charity Plata (CSI) to streamline our new website. Meeting with her again next week to start the process of improving documentation. We have provided her with some general documents to start with.
- Upgrade of USATLAS code browser is underway, replacing existing https://acode-browser2.usatlas.bnl.gov. Cut off date to be decided.
- Elog deployment for Phenix is underway, existing data in the counting house will be migrated over and plan to be the central location for the data store for Phenix.
- Established authentication flow for DataArt (the 3rd party vendor) project created for USATLAS, connecting to CERN SSO using a unique approach and consume 'egroups' for authorization for access, the project is now moving forward towards the next stage - hosting a demo site to open up to users for further feedback

BNL Box
- Uploaded a revised BNL Box theme to production. Due to architectural limitations, the guest login form is not initially hidden, but placeholder text and other verbiage has been modified to indicate the login form is for guest users only. This eliminates the problem with guest account password resets created by the previous solution. (C. Lepore/O. Rind)
