

CO₂-Laser based post-processing of ATF e⁻ beam driven positron-electron jets

A. Sahai (PI), CU Denver, H. Chen (co-PI), LLNL

V. Harid, M. Golkowski, CU Denver

J. Resta-Lopez, Cockcroft Inst. & U Valencia

S. Palaniyappan, LANL, J. Cary, Tech-X & CU

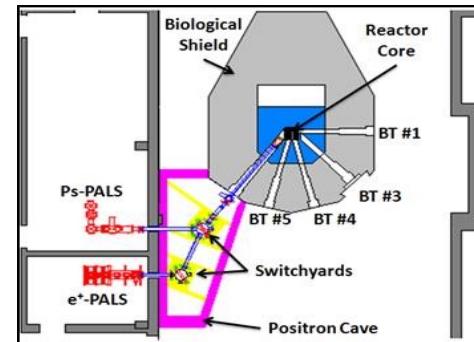

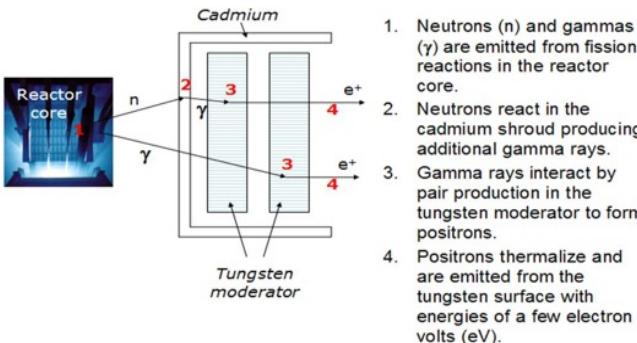

Funding source: CU multi-year grant (ongoing)
DOE (applied)

US Patent 16,770,943

Key scientific goals

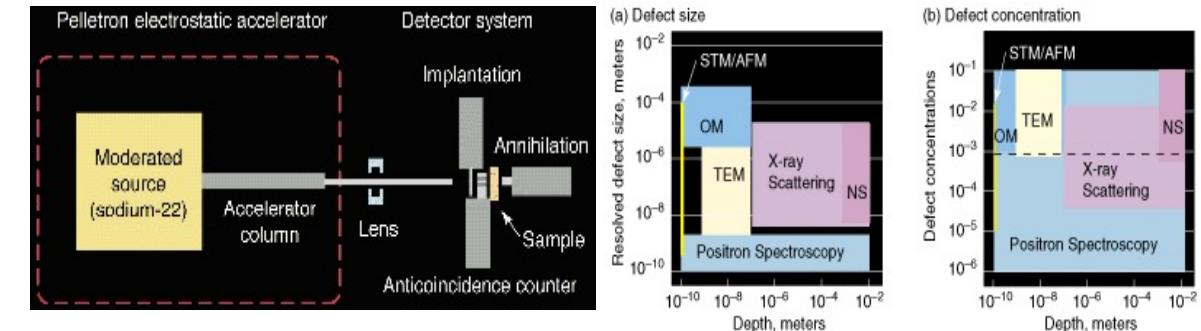

- positron source with tunable properties - **control the interaction**
 CO_2 laser-driven post-processing of ATF e-beam driven particle showers
- **tunable yet collisionless moderator**
- **NOT** aimed at production of high-energy
low-emittance positron beams for collider applications
- long wavelength CO_2 laser (compared to Ti:Sapphire):
larger plasma structures – easier to physically overlay with the showers
slower structures for a lower plasma density – laser velocity slower for same density
- numerous applications benefit from a tunable positron beam

Current positron sources

Laser shower production

Supplementary material Figure 1: Typical series of ten spectra of the laser-accelerated electron beam, as recorded on the LANEX screen before the insertion of the solid target. The overall electron beam charge fluctuated within less than 10% and the peak electron energy was consistently of the order of 200 MeV.

Laser shots NOT consistent !

increases for materials with higher atomic number. This trend is quantitatively confirmed by integrating the experimental spectra in the range $90 < E_{e^+}(\text{MeV}) < 120$ (see Table I and Fig. 3). Within this energy range, a maximum positron number of $(2.30 \pm 0.28) \times 10^5$ is obtained for the material with the highest Z (Pb). Fitting the data keeping j as a free parameter, we obtain a best fit for $j = 2.1 \pm 0.1$

- Parabola with hole for re-directing the electron beam
- 3" diam parabolas with 5 mm hole available at ATF
- ATF has different parabolas with F varying between 100-250 mm. They are between 3-4" dia. But only 3" dia have holes
- Axicon pair telescope to split, expand and combine the laser beam
- Axicon pair is already in-stock at ATF
- The axicon pair cannot be used for our full power

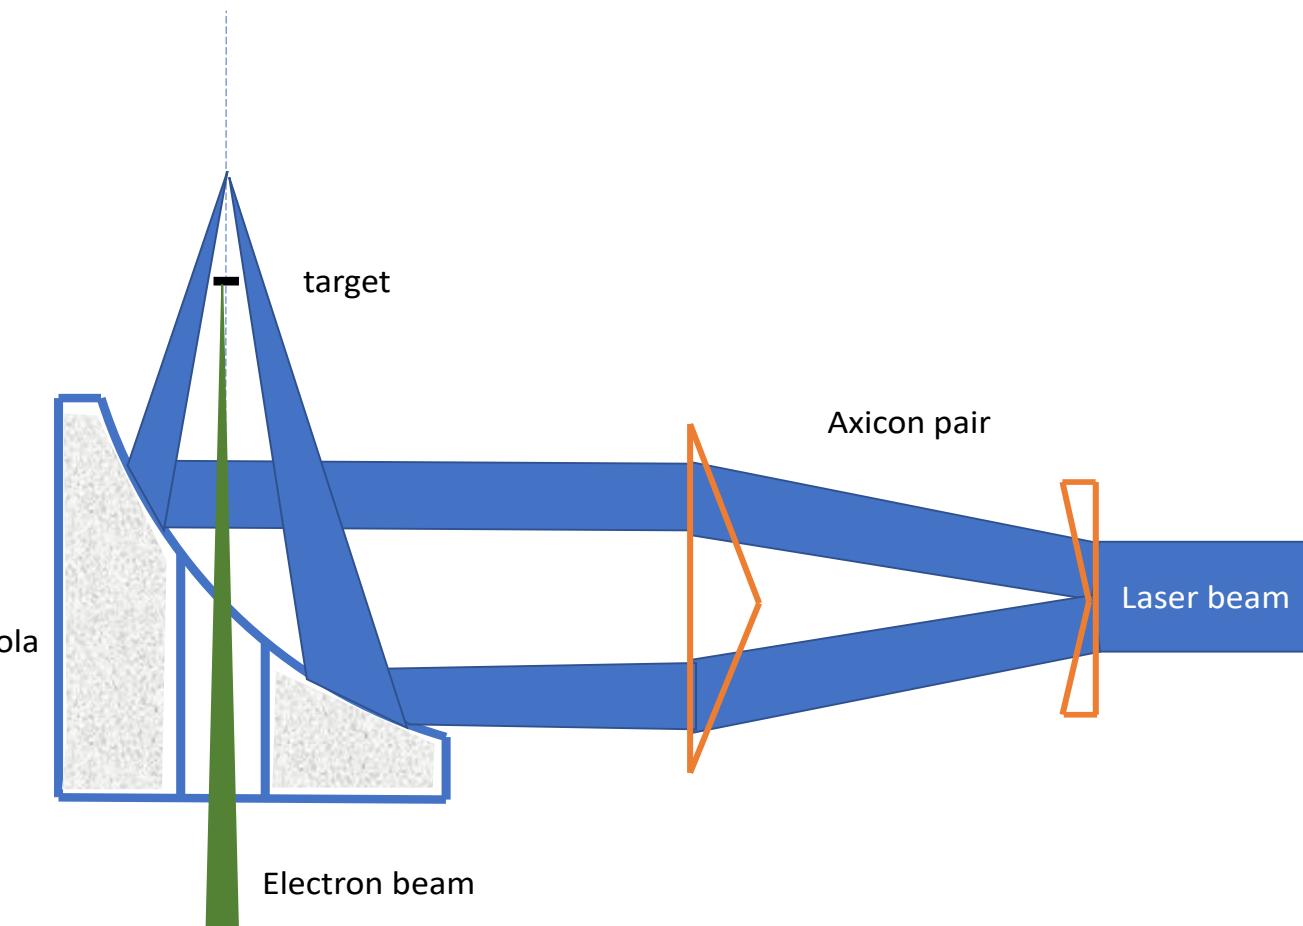

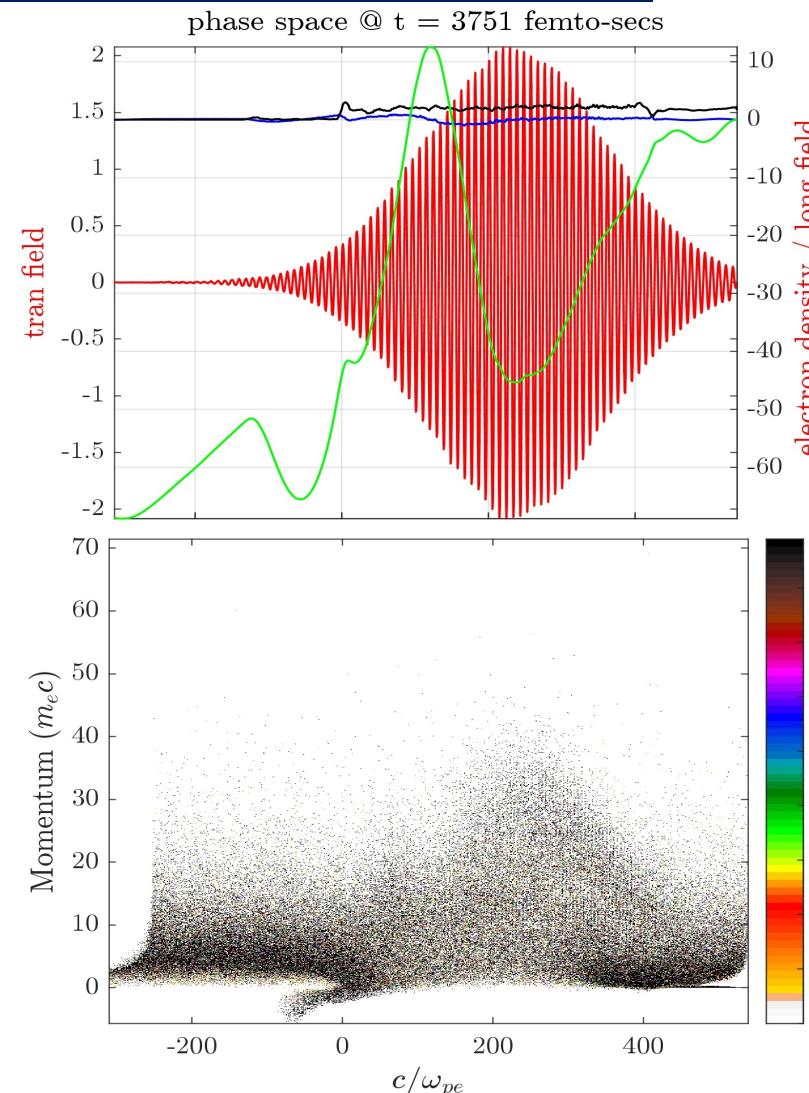

Figure 7: Parabola with hole and axicon-pair setup for laser delivery

Sim of CO₂ laser driven plasma processing

- 2D PIC EPOCH simulations – CO₂ laser-driven post-processing of ATF beam-driven showers
- Shower properties determined using GEANT4
- Initialize a long shower ~ 2.5 ps
- CO₂ Laser-driven structures – can trap and slow-down positrons

Plasma parameters	1TW	2TW

Proposed Milestones

Yr. 1 – ONLY Electron beam

characterization of positron-electron jet production in solid target, over the sub-ps electron beam parameter-space (spot-size, charge, current) and its interaction with laser-ionized plasma

Yr. 2 – demonstration of spatio-temporal overlap between a high-power CO₂ laser pulse within the plasma-cell along with positron-electron jets

Yr. 3 – demonstration of tuning of the characteristics of positrons by scanning over electron beam, CO₂ laser and plasma properties.

Electron Beam Requirements

Parameter	Units	Typical Values	Comments	Requested Values
Beam Energy	MeV	50-65	<i>Full range is ~15-75 MeV with highest beam quality at nominal values</i>	60 MeV
Bunch Charge	nC	0.1-2.0	<i>Bunch length & emittance vary with charge</i>	1nC
Compression	fs	Down to 100 fs (up to 1 kA peak current)	<i>A magnetic bunch compressor available to compress bunch down to ~100 fs. Beam quality is variable depending on charge and amount of compression required.</i> <i>NOTE: Further compression options are being developed to provide bunch lengths down to the ~10 fs level</i>	0.1 - 1ps (10fs will be highly desirable when available ?)
Transverse size at IP (σ)	μm	30 – 100 (dependent on IP position)	<i>It is possible to achieve transverse sizes below 10 um with special permanent magnet optics.</i>	30-50 μm Can we get the PMQ triplet setup used earlier at BNL ?
Normalized Emittance	μm	1 (at 0.3 nC)	<i>Variable with bunch charge</i>	
Rep. Rate (Hz)	Hz	1.5	<i>3 Hz also available if needed</i>	
Trains mode	---	Single bunch	<i>Multi-bunch mode available. Trains of 24 or 48 ns spaced bunches.</i>	

CO₂ Laser Requirements

Configuration	Parameter	Units	Typical Values	Comments	Requested Values
CO₂ Regenerative Amplifier Beam	Wavelength	μm	9.2	<i>Wavelength determined by mixed isotope gain media</i>	9.2 μm
	Peak Power	GW	~3		3 GW
	Pulse Mode	---	Single		2 ps
	Pulse Length	ps	2		6 mJ
	Pulse Energy	mJ	6	<i>3 Hz also available if needed</i>	1.5
	M ²	---	~1.5		
	Repetition Rate	Hz	1.5		
CO₂ CPA Beam <i>Note that delivery of full power pulses to the Experimental Hall is presently limited to Beamline #1 only.</i>	Polarization	---	Linear	<i>Circular polarization available at slightly reduced power</i>	
	Wavelength	μm	9.2		9.2 μm
	Peak Power	TW	2		0.5 – 2 TW
	Pulse Mode	---	Single		
	Pulse Length	ps	2		2 ps
	Pulse Energy	J	~5		1-5 J
	M ²	---	~2		
	Repetition Rate	Hz	0.05	<i>Adjustable linear polarization along with circular</i>	
	Polarization		Linear		linear

- Electron Beam
 - plasma capillary discharge system

Experimental Time Request

CY2021 Time Request

Capability	Setup Hours	Running Hours
Electron Beam Only	24	80
Laser* Only (in Laser Rooms)		
Laser(s)* + Electron Beam		

Time Estimate for Remaining Years of Experiment (including CY2021)

Capability	Setup Hours	Running Hours
Electron Beam Only	Good for year 1 (but pre-amp CO ₂ level would be very useful)	
Laser* Only (in FEL Room)		
Laser(s)* + Electron Beam	80	300

* Laser = Near-IR or LWIR (CO₂) Laser
