Nonperturbative QCD

Interface between perturbative and nonperturbative regimes

- Define **universal** objects describing 3D hadron structure:
Generalized Parton Distributions (GPD).
- Relate GPDs to measurements using **factorization**:
Virtual Compton Scattering (DVCS, TCS),
Deeply Virtual Meson production (DVMP).
- Get **experimental knowledge** of hadron structure.

- **Matrix element** in the Breit frame ($a = q, g$):

$$\left\langle \frac{\Delta}{2} \left| T_a^{\mu\nu}(0) \right| - \frac{\Delta}{2} \right\rangle = M \left\{ \eta^{\mu 0} \eta^{\nu 0} \left[A_a(t) + \frac{t}{4M^2} B_a(t) \right] + \eta^{\mu\nu} \left[\bar{C}_a(t) - \frac{t}{M^2} C_a(t) \right] + \frac{\Delta^\mu \Delta^\nu}{M^2} C_a(t) \right\}$$

- Anisotropic fluid in **relativistic hydrodynamics**:

$$\Theta^{\mu\nu}(\vec{r}) = [\varepsilon(r) + p_t(r)] u^\mu u^\nu - p_t(r) \eta^{\mu\nu} + [p_r(r) - p_t(r)] \chi^\mu \chi^\nu$$

where u^μ and $\chi^\mu = x^\mu / r$.

- Define **isotropic pressure** and **pressure anisotropy**:

$$p(r) = \frac{p_r(r) + 2 p_t(r)}{3}$$

$$s(r) = p_r(r) - p_t(r)$$

Lorcé et al. (2019)

Bjorken regime : large Q^2 and fixed $xB \simeq 2\xi/(1 + \xi)$

- Partonic interpretation relies on **factorization theorems**.
- All-order proofs for DVCS.
- GPDs depend on a (arbitrary) factorization scale μ_F .
- **Consistency** requires the study of **different channels**.

- GPDs enter DVCS through **Compton Form Factors** :

$$\mathcal{F}(\xi, t, Q^2) = \int_{-1}^1 dx T\left(x, \xi, \alpha_S(\mu_F), \frac{Q}{\mu_F}\right) F(x, \xi, t, \mu_F)$$

for a given GPD F .

- CFF $\mathcal{F}$ is a **complex function**.

Almost all existing DVCS data sets.

2600+ measurements of 30 observables published during 2001-17.

1 Expand D-term on Gegenbauer polynomials

$$D_{\text{term}}^q(z, t, \mu_F^2) = (1 - z^2) \sum_{\text{odd } n} d_n^q(t, \mu_F^2) C_n^{3/2}(z)$$

2 Write dispersion relation for CFF (true at all pQCD orders)

$$C_H(t, Q^2) = \text{Re}\mathcal{H}(\xi) - \frac{1}{\pi} \int_0^1 d\xi' \text{Im}\mathcal{H}(\xi') \left(\frac{1}{\xi - \xi'} - \frac{1}{\xi + \xi'} \right)$$

3 Compute subtraction constant at LO

$$C_H(t, Q^2) = 4 \sum_q e_q^2 \sum_{\text{odd } n} d_n^q(t, \mu_F^2 \equiv Q^2)$$

Diehl & Ivanov (2007)

4 Retrieve GFF

$$d_1^q(t, \mu_F^2) = 5 C_q(t, \mu_F^2)$$

MontBlanc

HeritBLanc is a code devoted to the extraction of collinear distributions. So far, it has been used to determine the fragmentation functions (FFs) of the pion from experimental data for single-inclusive annihilation and semi-inclusive deep-inelastic scattering. Details concerning this fit of FFs in particular and the methodology in general can be found in the reference below.

The FF sets in the LHAPDF format for both positive and negative pions as well as for their sum can be found [here](#).

- NangaParbat and MontBlanc will soon be interoperable with PARTONS.
- **Single open source framework** for most of 1-parton distributions.

Precision 3D hadron structure

Motivation

Hadron structure
Parton distributions
Tomography
Internal pressure

Phenomenology

CFF global fit
Pressure forces
Models: systematic
uncertainties
Maximize theory
input
Deconvolution
problem

Ecosystem

Design
Associated libraries

Conclusion

Abbreviations

- Evolution code for PDFs, GPDs and TMDs.
- APFEL++ numerically solves evolution equations in x-space.
- Fully modular.

README.md

PASSED codefactor

APFEL++

A PDF evolution library in C++

Introduction

APFEL++ is a C++ rewriting of the Fortran 77 evolution code [APFEL](#). However, APFEL++ is based on a completely new code design and guarantees a better performance along with a more optimal memory management. The new modular structure allows for better maintainability and easier extensibility. This makes APFEL++ suitable for a wide range of tasks: from the solution of the DGLAP evolution equations to the computation of deep-inelastic-scattering (DIS) and single-inclusive-annihilation cross sections. Also more complex computations, such as differential semi-inclusive DIS and Drell-Yan cross sections, are easily implementable in APFEL++.

APFEL++ is used as a prediction engine in [NangaParbat](#), a code devoted to the extraction of Transverse-Momentum-Dependent (TMD) distributions, and in [MontBlanc](#), a code for the determination of collinear distributions. APFEL++ is also currently interfaced to [PARTONS](#), a software dedicated to the phenomenology of Generalised Parton Distributions (GPDs) and TMDs, and to [xFitter](#), an open source fit framework devoted to the extraction of collinear distributions and to the assessment of the impact of new experimental data.

Forward limit and DGLAP equations

- When $\kappa \rightarrow 0$, one recovers the forward DGLAP equations
 - Only the $\Theta(1-y)\mathcal{P}_1^{-(0)}(y;\kappa)$ term contributes to the evolution
 - No spurious singularity as $x < y < 1 < 1/\kappa$

- no ξ dependence in input
- Excellent agreement with native Apfel++ DGLAP evolution (red curve)
- Strong ξ dependence generated
- Continuity guaranteed at $x = \xi$ (cusp ?)

First validations

$x = \xi$ continuity, DLGAP limit and spurious divergences handling

ERBL Limit and Gegenbauer polynomials

cea

- When $\kappa \rightarrow 1/x$ (*i.e.* $\xi \rightarrow 1$) one recovers the ERBL kernel
 - ▶ Eigen basis known $\rightarrow$ 3/2-Gegenbauer Polynomials
 - ▶ Direct (albeit restricted to $\xi = 1$) comparison between x -space and conformal space evolution

- $H(x, 1) \propto (1 - x^2) C_4^{(3/2)}(x)$
- $\frac{H(x, 1, \mu)}{H(x, 1, \mu_0)} = \left(\frac{\alpha_S(\mu)}{\alpha_S(\mu_0)} \right)^{\gamma_4 / \beta_0}$
- Ratio is independent of x
- Excellent agreement between Apfel++ and conformal evolution in the ERBL limit

Additional validations

conformal evolution when $\xi \rightarrow 1$ guaranteeing the ERBL limit

Conclusion

Conclusion and prospects.

The quest towards 3D proton structure.

Conclusion

Abbreviations

- Strong **first-principle connection** between concepts and experimental data.
- Need for **multi-channel** analysis **beyond LO** on a **wide kinematic coverage**. EIC much needed!
- The GPD deconvolution problem is **ill-posed**. **Huge sensitivity** to numerical noise or experimental uncertainties.
- Benefiting from new inputs or constraints from **nonperturbative QCD** is highly desirable!
- Development of a **software ecosystem** for 3D hadron structure studies.
- Need for **coordinated effort** involving fits, computing chains e.g. PARTONS and continuum or lattice QCD to make the best from experimental data.
