Exotic heavy meson spectroscopy and structure with EIC
Physics Department, Stony Brook University

15-19 August 2022

Hidden charm and beauty hadrons reveal *tetraquarks* and *pentaquarks*

- Heavy quark pairs are difficult to be created or destroyed by QCD forces inside hadrons.
- Hadrons with a $c\bar{c}$ or $b\bar{b}$ pair *and* electrically charged *must* contain additional light quarks, *realising the hypothesis advanced by Gell-Mann in the Sixties*

M. Gell-Mann, A Schematic Model of Baryons and Mesons, PL 8, 214, 1964

- These are the exotic X, Y, Z mesons and the pentaquarks discovered over the last decade

Baryons can now be constructed from quarks by using the combinations (qqq) , $(qqqq\bar{q})$, etc., while mesons are made out of $(q\bar{q})$, $(qq\bar{q}\bar{q})$, etc. It is assuming that the lowest

There are indeed new valence quark configurations !!

- Tetraquarks are more easy to find at the increase of the quark mass, just as pentaquarks
- The presence of heavy quarks appears to increase the possibility of binding
- Hidden heavy flavors have been the first, now we also have the LHCb open heavy flavor $X_0(2900) J^P=0^+$ and $X_1(2900) J^P=1^-$ in the $D^+ K^-$ channel ($\bar{c}\bar{s}ud$ or $D^* K^*$ molecule ?)
 - First *unexpected charmonium* is the still controversial $X(3872)$ (discovered by Belle 2003)
- Still controversial because very close to the threshold

Expected and Unexpected Charmonia

- [3] R. Aaij *et al.* [LHCb Collaboration], Phys. Rev. Lett. **117** (2016) no.8, 082003

Why pentaquark states?

As well as revealing the new $P_c(4312)$ state with 7.3 sigma statistical significance, the LHCb 2019 analysis also uncovered **a more complex structure of $P_c(4450)$, consisting of two narrow nearby separate peaks, $P_c(4440)$ and $P_c(4457)$** with the two-peak structure hypothesis having a statistical significance of 5.4 sigma with respect to the single-peak structure hypothesis.

The masses and widths of the three narrow pentaquark states are as follows

State	M [MeV]	Γ [MeV]
$P_c(4312)^+$	$4311.9 \pm 0.7^{+6.8}_{-0.6}$	$9.8 \pm 2.7^{+3.7}_{-4.5}$
$P_c(4440)^+$	$4440.3 \pm 1.3^{+4.1}_{-4.7}$	$20.6 \pm 4.9^{+8.7}_{-10.1}$
$P_c(4457)^+$	$4457.3 \pm 0.6^{+4.1}_{-1.7}$	$6.4 \pm 2.0^{+5.7}_{-1.9}$

[*] R. Aaij et al. (LHCb), Phys. Rev. Lett. 122, 222001 (2019).

$\Lambda_b^0 \rightarrow J/\Psi p K^-$ channel ($P_c \rightarrow J/\Psi p$)

Number of events versus J/Psi p invariant mass [*]. The mass thresholds for the $\Sigma_c \bar{D}$ and $\Sigma_c \bar{D}^*$ final states are superimposed.

2021

P_{cs} ($uds\bar{c}\bar{c}$)

(2021) LHCb, *Sci.Bull.* 66 (2021) 1278-1287

$\Lambda_b^0 \rightarrow J/\Psi \Lambda K^-$ channel ($P_{cs} \rightarrow J/\Psi \Lambda$)

Significance of $P_{cs}^0(4459)$ exceeds 3σ after considering all the systematic uncertainties.

Mass of $P_{cs}(4459)^0$ 19 MeV below the $\Xi_c^0 \bar{D}^{*0}$ threshold, similar to $P_c(4440)^+$ and $P_c(4457)^+$ pentaquark states.

August 2021

Evidence for a new structure
in the $J/\psi p$ and $J/\psi \bar{p}$ systems
in $B_s^0 \rightarrow J/\psi p \bar{p}$ decays

arXiv:2108.04720v1 [hep-ex] 10 Aug 2021

$$B_s^0 \rightarrow (P_c^+) \bar{p} \rightarrow (J/\Psi p) \bar{p}$$
$$\bar{B}_s^0 \rightarrow (P_c^-) p \rightarrow (J/\Psi \bar{p}) p$$

$$M_{P_c} = 4337^{+7}_{-4} {}^{+2}_{-2} \text{ MeV},$$

$$\Gamma_{P_c} = 29^{+26}_{-12} {}^{+14}_{-14} \text{ MeV},$$

The $P_c(4437)$ statistical significance is in the range of 3.1 to 3.7 depending on the assigned J^P hypothesis:

$$3.1 \text{ sigma for } J^P = \frac{1}{2}^+$$

$$3.7 \text{ sigma for } J^P = \frac{3}{2}^+$$

2022 Pcs(4338)

- the Pcs(4338) was announced recently by LHCb at around $M = 4338$ MeV in $B^- \rightarrow J/\psi \Lambda^- p$.

Using only symmetry considerations, and an equal spaced mass formula, we have predicted the strange pentaquark with $I=0$ $P_{cs}(4457)$ for which LHCb reported evidence (LHCb, *Sci.Bull.* 66 (2021) 1278-1287) and suggested to look for it in the $\Lambda J/\Psi$ channel (in fact cited by LHCb). According to our model also $I=1$ P_{cs} should exist (in the $\Sigma J/\Psi$ channel) and $I=1/2$ P_{css} (in $\Xi J/\Psi$ channel)

Compact $5q$ state?

We have predicted the strange pentaquark with $I=0$, P_{CS}^0 , for which LHCb reported evidence at $M=4459$ MeV and suggested to look for it in the $\Lambda J/\Psi$ channel. According to our model also $I=1$ P_{CS} should exist (in the $\Sigma J/\Psi$ channel) and $I=1/2$ P_{CSS} (in $\Xi J/\Psi$ channel).

$$J^P = \frac{3}{2}^-$$

Hidden-charm pentaquarks as a meson-baryon molecule with coupled channels for $\bar{D}^{(*)}\Lambda_c$ and $\bar{D}^{(*)}\Sigma_c$

Y. Yamaguchi, E. Santopinto, Phys. Rev. D Phys.Rev. D96 (2017) no.1, 014018

- ▶ Near the thresholds, resonances are expected to have an exotic structure, like the hadronic molecules.
- ▶ **The observed pentaquarks are found to be just below the $\bar{D}^* \Sigma_c$ ($P_c^+(4380)$) and the $\bar{D}^* \Sigma_c^*$ ($P_c^+(4450)$) thresholds. Moreover, the $\bar{D}^* \Lambda_c$ threshold is only 25 MeV below the $\bar{D} \Sigma_c$ threshold. For this reason, the $\bar{D} \Lambda_c, \bar{D}^* \Lambda_c$ channels are not irrelevant in the hidden-charm meson-baryon molecules.**

In Phys.Rev. D96 (2017) no.1, 014018 E. Santopinto e Y. Yamaguchi considered the coupled channel systems of $\bar{D} \Lambda_c, \bar{D}^* \Lambda_c, \bar{D} \Sigma_c, \bar{D} \Sigma_c^*, \bar{D}^* \Sigma_c$ and $\bar{D}^* \Sigma_c^*$ to predict the bound and the resonant states in the hidden-charm sector. **The binding interaction between the meson and the baryon is given by the One Meson Exchange Potential (OMEP).**

**Upgrade of the model:
Coupled channel between the
meson-baryon states and the five
quark states**

- ▶ In the current problem of pentaquark P_c , there are two competing sets of channels: the meson-baryon (MB) channels and the five-quark channels.

**CAN A COUPLE CHANNEL BETWEEN
THE MB CHANNELS AND THE CORE CONTRIBUTION
DESCRIBE IN A MORE REALISTIC WAY THE PENTAQUARK STATES ?**

Coupled channel between the meson-baryon states and the five quark states

Hidden-charm and bottom meson-baryon molecules coupled with five-quark states, Y. Yamaguchi, A. Giachino, A. Hosaka, E. S., S. Tacheuchi, M. Takizawa, Phys .Rev. D96 (2017) no.11, 114031

- ▶ Hidden-charm pentaquarks as $\bar{D} \Lambda_c, \bar{D}^* \Lambda_c, \bar{D} \Sigma_c, \bar{D}^* \Sigma_c, \bar{D} \Sigma_c^*,$ and $\bar{D}^* \Sigma_c^*$, and molecules coupled to the five-quark states

ADDITION OF THE CORE CONTRIBUTION

- ▶ For the first time some predictions for the hidden bottom pentaquarks as $\bar{D} \Lambda_c, \bar{D}^* \Lambda_c, \bar{D} \Sigma_c, \bar{D}^* \Sigma_c, \bar{D} \Sigma_c^*$ and $\bar{D}^* \Sigma_c^*$ molecules coupled to the five-quark states are provided.
- ▶ In particular, by solving the coupled channel Schrödinger equation, we study the the bound and resonant hidden-charm

Model setup in this study

- ▶ **Hadronic molecule + Compact state ($5q$)**
⇒ Meson-Baryon couples to $5q$ (Fashbach projection)

Meson-Baryon interactions

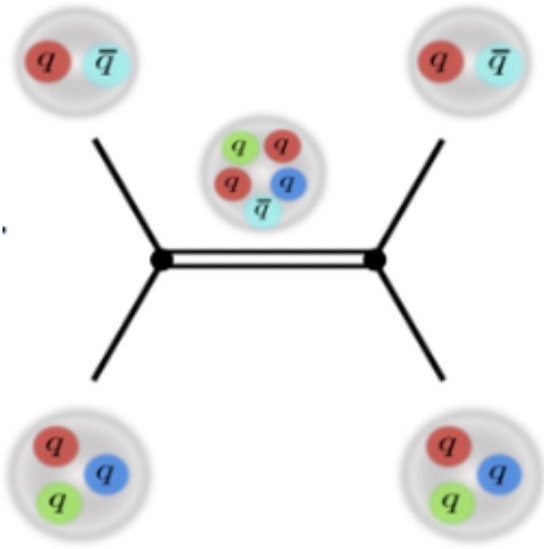

- ▶ **Long range** interaction: One pion exchange potential (OPEP)
- ▶ **Short range** interaction: $5q$ potential

1. Long range force: One pion exchange potential

Long range force

2. Short range force: 5-quark potential

Short range force

Hidden-charm and bottom meson-baryon molecules coupled with five-quark states [3]

- In Refs. [3] we studied the hidden-charm pentaquarks by coupling the $\Lambda_c \bar{D}^{(*)}$ and $\Sigma_c^* \bar{D}^{(*)}$ meson-baryon channels to a $uudc\bar{c}$ compact core with a meson-baryon binding interaction satisfying the heavy quark and chiral symmetries.

We predicted the three pentaquark states, $P_c(4312)$, $P_c(4440)$ and $P_c(4457)$ two years before the experimental observation by LHCb.

For this reason we wrote a Rapid Communication, Y. Yamaguchi, H. Garcia-Tecocoatzi, A. Giachino, A. Hosaka, E. Santopinto, S. Takeuchi and M. Takizawa Phys.Rev.D **101** (2020) 091502 (R)

Four-Heavy-Quark Tetraquarks

Observation claims of a 4μ on peak in 2Υ spectrum circulated in 2018-2019

- A Genova-Roma collaboration set up to compute lifetime & branching ratios for fully bottom 0^{++} tetraquark, also in view of the luminosity upgrade of LHCb;
- we also included the 2^{++} state (2^{++} has a production cross-section a factor 5 larger than 0^{++} and a larger 4μ Bf !)

C.Becchi, A.Giachino, L.Maiani and E.Santopinto, Phys. Lett. **B 806**, 135495

- Very discouraging results were obtained for the 4μ on channel of $4b$ tetraquarks: $\sigma \sim 0.1\text{fb}$ or less, made the positive claims rather unlikely.

- In March 2020, we realised that fully charmed tetraquarks would be more favorable.
- Our paper on fully charmed tetraquarks appeared on ArXiv on June 25.

C.Becchi, J. Ferretti, A. Giachino, L.Maiani and E.Santopinto, arXiv:2006.14388, Phys.Lett. **B 811** (2020) 135952

Tetraquark picture of 2 J/Ψ resonances

Describing the X(6900) structure with a Breit Wigner lineshape, its mass and natural width are determined to be ([arXiv:2006.16957](https://arxiv.org/abs/2006.16957), 30 Jun 2020, now Science Bulletin, Volume 65, Issue 23, 1983 (2020)):

$$m[X(6900)] = 6905 \pm 11 \pm 7 \text{ MeV}/c^2$$

$$\Gamma[X(6900)] = 80 \pm 19 \pm 33 \text{ MeV},$$

The statistical significance of X(6900) is greater than 5.1σ

Tetraquark constituent picture of 2 J/Ψ resonances

$$[cc]_{(S=1)}[c^-c^-]_{(S=1)}$$

- $[cc]$ in color $\bar{3}$

Decays and branching fractions

- Decays take place via $c\bar{c}$ annihilation. The starting point is to bring the $c\bar{c}$ pairs together

$$\mathcal{F}(J=0^{++}) = \left| \left((cc)_{\bar{3}}^1 (\bar{c}\bar{c})_3^1 \right)_1^0 \right|^2 = -\frac{1}{2} \left(\sqrt{\frac{1}{3}} \left| (c\bar{c})_1^1 (c\bar{c})_1^1 \right>_1^0 - \sqrt{\frac{2}{3}} \left| (c\bar{c})_8^1 (c\bar{c})_8^1 \right>_1^0 \right) + \frac{\sqrt{3}}{2} \left(\sqrt{\frac{1}{3}} \left| (c\bar{c})_1^0 (c\bar{c})_1^0 \right>_1^0 - \sqrt{\frac{2}{3}} \left| (c\bar{c})_8^0 (c\bar{c})_8^0 \right>_1^0 \right)$$

- Four possible annihilations:

- 1 a color singlet pair of spin 1 (0) annihilates into a J/Ψ (η_c), the other pair rearranges into the available states (near threshold: J/Ψ or η_c again);
- 2 a color octet, spin 1 pair annihilates into a pair of light quark flavours, $q=u,d,s$ and the latter recombine with the spectator pair to produce a pair of lower-lying, open-charm mesons. A similar process from color octet spin 0 pair is higher order in α_s and neglected.

- Rates are computed with the formula (well known in atomic physics):

$$\bullet \Gamma = |\Psi_T(0)|^2 \cdot |\mathbf{v}| \cdot \sigma(cc^- \rightarrow f)$$

- Branching fractions are independent from $|\Psi_T(0)|^2$
- Total rates: see later.

2J/Ψ and 4μ cross sections

- We give the upper bound: $\sigma_{theo.}(\mathcal{T} \rightarrow 4\mu) \leq \sigma(pp \rightarrow 2 J/\Psi)[B(J/\Psi \rightarrow 2 \mu)]^2$
- With: $\sigma(pp \rightarrow 2 J/\Psi) \simeq 15.2 \text{ nb}$ (LHCb @ 13 TeV, Aaij : 2016bqq)

The limiting cross sections (in fb) are shown in the table

[cc][c̄c̄]	Decay channel	BF in \mathcal{T} decay	Cross section upper limit (fb)
$J = 0^{++}$	$\mathcal{T} \rightarrow D^{(*)+}D^{(*)-} \rightarrow e + \mu + \dots$	$2.3 \cdot 10^{-3}$	$3.6 \cdot 10^4$ (36 pb)
	$\mathcal{T} \rightarrow D^{(*)0}\bar{D}^{(*)0} \rightarrow e + \mu + \dots$	$0.36 \cdot 10^{-3}$	$0.55 \cdot 10^4$ (6 pb)
	$\mathcal{T} \rightarrow 4\mu$	$2.6 \cdot 10^{-6}$	39
$J = 2^{++}$	$\mathcal{T} \rightarrow D^{*+}\bar{D}^{*-} \rightarrow e + \mu + \dots$	$7.0 \cdot 10^{-3}$	$53 \cdot 10^4$ (532 pb)
	$\mathcal{T} \rightarrow D^{*0}\bar{D}^{*0} \rightarrow e + \mu + \dots$	$1.1 \cdot 10^{-3}$	$8.3 \cdot 10^4$ (83 pb)
	$\mathcal{T} \rightarrow 4\mu$	$1.0 \cdot 10^{-5}$	780

780:39=20 !!

$$B_{4\mu}(2^{++}) : B_{4\mu}(0^{++}) \sim 4:1; \quad \sigma(2^{++}) : \sigma(0^{++}) = 5 : 1$$

A visibility ratio 20:1 !!

- Branching ratios in 4 muons are more favorable in 4 c than in 4 b tetraquarks
- Among 4 c, the Branching Ratio is more favorable for the 2^{++} (a factor 4)
- In addition 2^{++} is produced in pp collision with a statistical factor $2J+1=5$

Total widths and mass spectrum

- Total widths are proportional to the ratio: $\xi = |\Psi_T(0)|^2 / |\Psi_{J/\psi}(0)|^2$
- we determine ξ from models

$$\xi = 4.6 \pm 1.4$$

$$\Gamma(0^{++}) \cong \Gamma(2^{++}) = (97 \pm 30) \text{ MeV}$$

Predictions of exotic strange hidden charm tetraquark and pentaquarks, published on Science Bulletin 2022 (Impact Factor 11,78) :

The new P_{cs} .4459.; Z_{cs} .3985.; Z_{cs} .4000. and Z_{cs} .4220. and the possible emergence of flavor pentaquark octets and tetraquark nonets

J. Ferretti, E. Santopinto (July 2022)
Science Bulletin 67 (2022) 1209–1212
doi.org/10.1016/j.scib.2022.04.010

Fig. 2. (Color online) $J^P = \frac{1}{2}^+$ pentaquark octet, made up of the bound states of octet baryons plus the $\chi_{c0}(1P)$ (a), and $J^P = \frac{1}{2}^-$ or $J^P = \frac{3}{2}^-$ pentaquark octet, made up of the bound states of octet baryons plus the $\psi(2S)$ (b). The predicted hadro-charmonium masses are reported inside square brackets, the experimental ones are inside round brackets. See the [Supplementary materials](#) for more details.

Hidden-charm tetraquarks in the diquark-antidiquark model

M. Naeem Anwar, J. Ferretti and E. Santopinto, PRD **98**, 094015 (2018) [only tetraquarks with null strangeness]

J. Ferretti and E. Santopinto, JHEP **04**, 119 (2020) [tetraquarks with a strangeness content]

J. Ferretti and E. Santopinto, arXiv:2111.08650, accepted on Sci. Bull. [SU(3) flavor tetraquark multiplets]

If the light (q anti- q , with $q = u, d$ or s) and heavy (c anti- c) degrees of freedom are somehow decoupled because of their large mass difference, then the tetraquark multiplet structure is provided by the light component (c anti- c being in flavor singlet) \rightarrow emergence of $SU(3)_f$ multiplets in the hidden-charm sector.

Compact tetraquark multiplets. Theoretical predictions (in square brackets) for the masses are compared to the experimental data (when available). By $C = \pm 1$ nonets we refer to the sign of charge conjugation of the neutral-non-strange members.

Hadro-charmonium (hadro-quarkonium) model

The idea of the hadro-charmonium model was introduced by Dubynskiy and Voloshin in Phys. Lett. B **666**, 344 (2008).

In the hadro-charmonium picture a colorless heavy quarkonium “kernel”, Q anti- Q , interacts with a larger light quark “shell”, q anti- q or qqq , through Multiple gluon-exchange forces (the QCD analogue of van der Waals forces between molecules)

Composition	Quark content	$\alpha_{\psi\psi}(n\ell)$ [GeV $^{-3}$]	J_{tot}^P	Mass (Binding) [MeV]
$\chi_{c0}(1P) \otimes K$	$n\bar{s}c\bar{c}$ ($s\bar{n}c\bar{c}$)	11	0^-	3886 (−22)
$\eta_c(2S) \otimes K$	$n\bar{s}c\bar{c}$ ($s\bar{n}c\bar{c}$)	18	0^+	3948 (−183)
$\chi_{c1}(1P) \otimes K$	$n\bar{s}c\bar{c}$ ($s\bar{n}c\bar{c}$)	11	1^-	3981 (−23)
$\psi(2S) \otimes K$	$n\bar{s}c\bar{c}$ ($s\bar{n}c\bar{c}$)	18	1^+	3996 (−184)
$h_c(1P) \otimes K$	$n\bar{s}c\bar{c}$ ($s\bar{n}c\bar{c}$)	11	1^-	3996 (−23)
$\chi_{c2}(1P) \otimes K$	$n\bar{s}c\bar{c}$ ($s\bar{n}c\bar{c}$)	11	2^-	4027 (−23)

$Z_{cs}(3985)$ & $Z_{cs}(4003)$

In the hadro-charmonium model there is only one multiplet with $J^P = 1^+$ \rightarrow either the two Z_{cs} states belong to the same multiplet (unlikely) OR the two Z_{cs} states have a different nature (e.g. one is hadro-charmonium and the other is a molecular state)

Possibility to use the tetraquark multiplet structure (in combination with predictions for the decay widths, production cross-sections ...) to discriminate among the different interpretations

How to validate or not these models in future analysis

1) The study of J^P quantum numbers (the quantum numbers are often still to be measured)

2) As written is

PHYSICAL REVIEW D **96**, 014014 (2017)

Compact pentaquark structures

Elena Santopinto and Alessandro Giachino

We observe that, if the compact pentaquark description is correct, the other octet states will also be observed by the LHC_b Collaboration. By contrast, if the pentaquark is mainly a molecular state, it is not necessary that all the states of that multiplet should exist.

Abstract

Recent observations in heavy-quark spectroscopy have provided numerous candidates for hadronic resonances which are exotic in nature. The Electron Ion Collider (EIC) has the potential to produce such resonances in photoproduction reactions, which would confirm the observations in previous experiments and provide complementary insight into their composition. This opportunity has inspired recent work on theoretical models for exclusive production of so-called XYZ states in electron-hadron collisions as well as detector simulations to meet the requirements of such a program at the EIC.
