

# Computing Plan Notes

Joe Osborn

February 16, 2022

# Overall (Personal) Comments

- The introduction could benefit from some EIC overview and a broadened scope. Right now it just dives right into ECCE computing
  - Reads more like an internal analysis note than an external paper
- Some parts of the text feel disjointed and need better integration with surrounding sections
  - Example: AI based data selection is excellent addition to the online section, but contains some physics discussion, discussion about the DOE award which are maybe extraneous for a computing focused paper
- A lot of the text assumes knowledge of the EIC and computing in general (e.g. undefined acronyms)
- There are many instances where we explicitly draw parallels to sPHENIX. May consider toning this down a bit
- Large variation of discussion : what we will do vs. what we are doing vs. what has been done.
  - Example: What we will do - SRO. What we are doing - AI assisted detector design. What has been done - details on simulation campaigns for proposal
- Needs a conclusion
