• Summary
An international flagship experiment to unlock the mysteries of neutrinos

Three major discovery areas

**Origin of Matter**
DUNE scientists will look at the differences in behavior between neutrinos and antineutrinos, aiming to find out whether neutrinos are the reason the universe is made of matter.

**Unification of forces**
DUNE’s search for the signal of proton decay—a signal so rare it has never been seen—will move scientists closer to realizing Einstein’s dream of a unified theory of matter and energy.

**Black hole formation**
DUNE will look for the gigantic streams of neutrinos emitted by exploding stars to watch the formation of neutron stars and black holes in real time, and learn more about these mysterious objects in space.
Development of LArTPC for Neutrino Experiments

Liquid Argon TPC

Charged particles passing through detector ionize the argon atoms, and the ionization electrons drift in the electric field to the anode wall on a timescale of milliseconds. The anode consists of layers of active wires forming a grid.

- 3 Wire Plane readout with Excellent Space and Energy resolution
- 3D-imaging: full event topology reconstruction
- Higher sensitivity to neutrino physics and for some of the proton decay channels (e.g. $p \rightarrow K\nu$)
Signal Formation:
Induced Signals from a Track Segment

DUNE style wire arrangement: 3 instrumented wire planes + 1 grid plane
Raw current waveforms convolved with a 0.5\(\mu\)s gaussian to mimic diffusion

Charge signal is very small due to there is no electron amplification inside Lar.
“Warm” Electronics

- A typical readout configuration with warm electronics: long cables connect the sense wires to the FEE, resulting in high capacitance and large electronics noise.
- To reduce the cable length, one has to implement cold feedthroughs below the liquid level, which increases the cryostat complexity.
“Warm” Electronics

Noise (ENC) vs TPC Sense Wire and Signal Cable Length

MIP Signal for 3x3 and 5x5 mm Sense Wire Spacing

The expected signal for 3mm wire spacing is then \( \approx 1fC = 6250 \) e, ... and for 5mm, \( \approx 10^4 \) e, for the “collection signal”

10kton DUNE LArTPC with warm electronics (300K) ENC \( \sim 6 \times 10^3 \) e rms

DUNE: Total ENC shall be less than 1/9 of the expected worse case instantaneous charge arriving at the APA from a MIP.
Cryogenic Electronics is the Optimal Solution for Large LArTPCs
Cold electronics for “Giant” Liquid Argon Time Projection Chambers

1st International Workshop towards the Giant Liquid Argon Charge Imaging Experiment (GLA2010)

Abstract. The choice between cold and warm electronics (inside or outside the cryostat) in very large LAr TPCs (>5-10 ktons) is not an electronics issue, but it is rather a major cryostat design issue. This is because the location of the signal processing electronics has a direct and far reaching effect on the cryostat design, an indirect effect on the TPC electrode design (sense wire spacing, wire length and drift distance), and a significant effect on the TPC performance. All these factors weigh so overwhelmingly in favor of the cold electronics that it remains an optimal solution for very large TPCs. In this paper signal and noise considerations are summarized, the concept of the readout chain is described, and the guidelines for design of CMOS circuits for operation in liquid argon (at ~89 K) are discussed.
Advantages of Cryogenic ("Cold") Electronics

• Having front-end electronics in the cryostat, close to the wire electrodes yields the best SNR. Noise is independent of the fiducial volume.

• Highly multiplexed circuits with fewer digital output lines not only greatly reduce the number of cryostat penetrations, but also give the designers of both the TPC and the cryostat the freedom to choose the optimum configurations.
“Cold” Electronics as an Optimal Solution

Noise (ENC) vs TPC Sense Wire and Signal Cable Length

MIP Signal for 3x3 and 5x5 mm Sense Wire Spacing

The expected signal for 3mm wire spacing is then $\approx 1fC = 6250$ e, ... and for 5mm, $\approx 10^4$ e, for the “collection signal”

No limit on the cable length within the cryostat after the signals are amplified and digitized at the sense wires.
A Brief but Long History of CE Development

- BNL pioneered LAr based detector technology in 1974 [1]
- Physics/Engineering expertise which has made essential contributions to various programs, e.g. ATLAS, MicroBooNE
- Unique experience in cryogenic electronics and micro-electronics
- The R&D effort makes the experiments possible; the experiments, in turn, feed information back into the R&D process
- Cryogenic/Cold electronics development is making continuous advancement, from JFET to CMOS, from analog front-end to mixed signal ADC and FPGA
- **A strong cold electronics team is built up as a core BNL competence, in close collaboration with other institutes, to realize various LAr TPC experiments**

ProtoDUNE

• ProtoDUNE provides critical validation of technology, detector performance, and long-term stability

- BNL focused on ProtoDUNE-SP Cold Electronics R&D (both electrical and mechanical), production, installation and commissioning

Success made possible by CERN Neutrino Platform
ProtoDUNE-SP Phase I

- NP04 experiment at CERN
  - 400-ton fiducial LArTPC
  - Sit in H4 beam line
- Single-phase TPC prototype
  - Use full scale components of DUNE far detector module
  - 6 full-size APAs plus 3 CPAs
    - 2 x 3.6m drift regions
  - Total 15,360 TPC channels
  - RUN I has been completed in 2020
  - RUN II is planned ~2022
- A key test of:
  - Components
  - Construction methods
  - Installation procedures
  - Commissioning
  - Detector response to particles
  - Confirm modeling and simulation
ProtoDUNE-SP Phase I Cold Electronics System

Warm interface electronics
- Warm Interface Electronics Crate (6)
- Warm Interface Board (30)
- Power and Timing Card (6)
- Power and Timing Backplane (6)

CE flange
- Flange assembly with cable strain relief and flange PCB for cable/WIB connection (6)

Signal feed-through
- Tee pipe with 14” Conflat flanges and crossing tube cable (CTC) support (6)

Cold cable
- LV and data cable (120+120) to FEMB and APA wire-bias
- SHV cable (48)

Front End Motherboard (FEMB)
- 128 channels of digitized wire readout enclosed in CE Box (120)
Cold Electronics R&D

Front end ASIC
~ 5mW/ch.

ADC ASIC
~ 5mW/ch.

FPGA (COTS)
~ 8mW/ch.

voltage regulation (COTS)
(< 100mV dropout)

overall 128:4 multiplexing

R&D produced key components to form a complete cold front-end readout chain for LAr TPC experiments
One WIEC for One APA Readout

Cooling system
ENC Projection Based on 40% APA

- 40% APA
  - U/V wire: 4.0 m
  - Y wire: 2.8 m

- ProtoDUNE APA
  - U/V wire: 7.39m
  - Y wire: 6.0m

Note: 82pF and 150pF mica capacitors are added on some wires

- DUNE Far Detector
  - Same APA as ProtoDUNE-SP
  - Threshold: 1,000 e⁻
  - Goal: as low as possible
# CERN Cold Box Integration Test

**APA2 (2018-01)**  
Cold nitrogen gas with lowest temperature reached ~ 159K

### Cooling down

**Settings:**
- Gain: 25 mV/fC
- Tp: 2us

**ENC at 159K:**
- U-plane: 481 e⁻
- V-plane: 481 e⁻
- X-plane: 398 e⁻

### Cryogenic temperature

ENC (Gain = 25 mV/fC, Tp = 2.0μs) vs. Temperature

### Warming up

1. Uniform gain (77 e⁻/bin) is applied for calculating noise of all channels
2. HV Bias voltages were off
3. Data are read out chip by chip over local diagnostic GbE port.
Shower Event under 7GeV Beam

Run 5194

Charge scale limited to “yellow”~ 3fC for monitoring

A monitor software glitch (minor)

Online Monitoring (Raw data)
Single-Phase LArTPC for the First DUNE Far Detector Module

DUNE 10 kt Far Detector LArTPC CE

- 150 APA units
- 384,000 channels
- 24,000 FE ASICs/24,000 ADC ASICs
- 6,000 COLDATA ASICs
- 3,000 Front End Mother Board assemblies

Aim for 30 years operation without replacement and maintenance

FD sits in 1.5 km underground

Outer:
- 65.8 m (L)
- 18.9 m (W)
- 17.8 m (H)

Inner active volume: 14.0 m (W) × 12.0 m (H) × 58.2 m (L)
Vertical-Drift (VD) LArTPC for the 2nd Far detector

Builds on experience gained with Dual Phase detector and long e-lifetime achieved in ProtoDUNE

- **Bottom Cold Electronics**
  - CE requirements are similar between HD and VD
    - Share the same or minor-modified FEMB design
  - 80 CRPs to be readout
    - 24 FEMB per CRP (charge-readout unit)

- **ProtoDUNE-VD has been planned**
  - 2 CRP will be readout by CE (48 FEMBs in need)
Evolution of Cold Electronics towards DUNE

ProtoDUNE-SP FEMB with Cold FPGA successfully verified the feasibility of digitized readout at 7-89 K

SBND FEMB with Cold FPGA and COTS ADC proves high-resolution readout can be achieved at 77-89 K

FEMB with three cryogenic-qualified ASICs (LArASIC, ColdADC, COLDATA) well addresses the long lifetime (30 years) and reliability requirements of DUNE far detector.
Summary

• Readout electronics developed for low temperatures (77 K – 300 K) is an enabling technology for noble liquid detectors for neutrino experiments

• Excellent performance of ProtoDUNE-SP
  – The integral design concept were sufficiently verified
  – High yield, low noise, good stability
  – A promising step towards DUNE-SP LArTPC

• CE with 3 ASIC solution meets the DUNE performance needs
  – Three cryogenic-qualified ASICs (LArASIC, ColdADC, COLDATA) for long lifetime (> 30 years) at 89K
  – ProtoDUNE-SP RUN-II in 2022 will be instrumented with final 3-ASIC FEMB
