*Only a selection of the available mass limits on new states or phenomena is shown.

^bSmall-radius (large-radius) jets are denoted by the letter j (J).

Where we are - LHC perspective

Targeting non-resonant signals of new physics

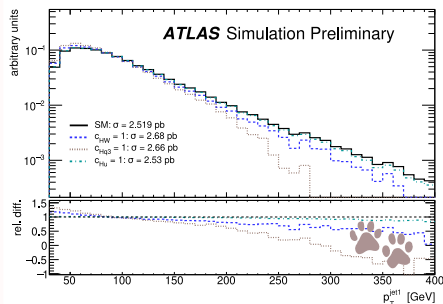

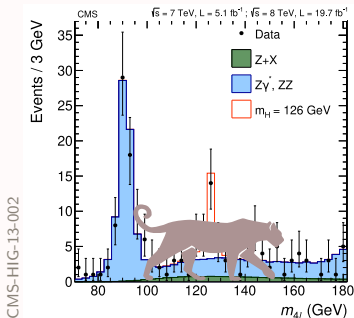

no clear indications of
specific BSM scenarios

+

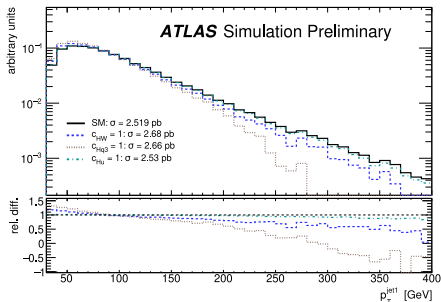

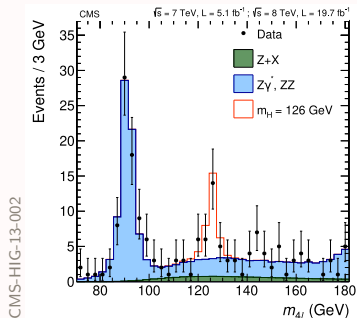

strong reduction of
statistical uncertainties

new strategies for NP searches
targeting **non-resonant** signals

Targeting non-resonant signals of new physics

ATLAS-PHYS-PUB-2019-042

► complementary to direct searches. will become more relevant in next Runs

► key idea: implement **a comprehensive, agnostic program**

► **Effective Field Theories** are a natural framework

- allow a (model-independent) NP interpretation of non-resonant effects
- well-defined mapping between theories in UV and at EW scale
- proper QFTs: renormalizable order-by-order, syst. improvable in loops
- allow combination with non-LHC measurements. “global likelihood”

Standard **M**odel **E**ffective **F**ield **T**heory:
The EFT constructed with **Standard Model** fields & symmetries

$$\mathcal{L}_{\text{SMEFT}} = \mathcal{L}_{\text{SM}} + \frac{1}{\Lambda} \mathcal{L}_5 + \frac{1}{\Lambda^2} \mathcal{L}_6 + \frac{1}{\Lambda^3} \mathcal{L}_7 + \frac{1}{\Lambda^4} \mathcal{L}_8 + \dots$$

$$\mathcal{L}_d = \sum_i C_i \mathcal{O}_i^{(d)}$$

C_i = Wilson coefficients

$\mathcal{O}_i^{(d)}$ = gauge-invariant operators

SMEFT describes **any nearly-decoupled** ($\Lambda \gg v$) **BSM physics**
with “good” analyticity/geometry properties in the scalar sector

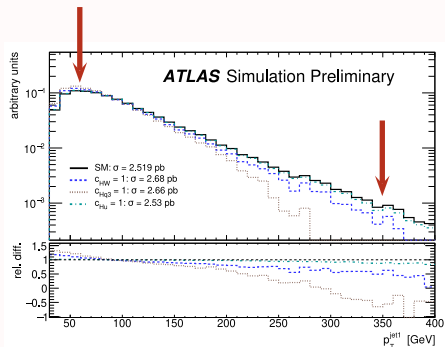

- ▶ default candidate for LHC/global program
- ▶ underwent enormous developments in past decade

Challenges for the bottom-up SMEFT program

1. being **sensitive** to indirect BSM effects \rightarrow needs uncertainty reduction

in bulk $\sim \frac{v^2}{\Lambda^2} = \frac{v^2 g_{UV}}{M^2}$. $g_{UV} \simeq 1$, $M \simeq 2 \text{ TeV} \rightarrow 1.5\%$

on tails $\sim \frac{E^2}{\Lambda^2} \simeq \frac{E^2 g_{UV}}{M^2}$ $E \simeq 1 \text{ TeV}$, $M \simeq 3 \text{ TeV} \rightarrow 10\%$

Challenges for the bottom-up SMEFT program

1. being **sensitive** to indirect BSM effects \rightarrow needs uncertainty reduction

$$\text{in bulk} \sim \frac{v^2}{\Lambda^2} = \frac{v^2 g_{UV}}{M^2}. \quad g_{UV} \simeq 1, \quad M \simeq 2 \text{ TeV} \rightarrow 1.5\%$$

$$\text{on tails} \sim \frac{E^2}{\Lambda^2} \simeq \frac{E^2 g_{UV}}{M^2} \quad E \simeq 1 \text{ TeV}, M \simeq 3 \text{ TeV} \rightarrow 10\%$$

2. making sure that, if we observe one, we **interpret it correctly**. needs:

- ▶ retaining all relevant contributions: all operators, NLO corrections...

- handling many parameters in predictions and fits
- understanding the theory structure
- ▶ correct understanding of uncertainties and correlations
- ▶ systematic mapping to BSM models

The development of SMEFT - quick wrap up

theory

- ▶ bases up to $d = 9$
- ▶ Hilbert series
- ▶ on-shell methods
- ▶ positivity
- ▶ unitarity bounds
- ▶ geometry

predictions

- ▶ RGEs for $d = 6$ and $d = 8$ (partial)
- ▶ predictions to NLO EW and NLO QCD
- ▶ first 2-loop results
- ▶ automation of RGE
- ▶ Monte Carlo at LO and NLO QCD
- ▶ predictions and studies for Higgs, top, diboson, VBS, Drell-Yan, dijet. . .
- ▶ SMEFT in PDFs

fits

- ▶ fitting technology/tools
- ▶ information geometry
PCA, Fisher info. . .
- ▶ strategies to extract differential info

map to other theories

- ▶ matching to 1-loop with functional methods
- ▶ automation of matching to models
- ▶ matching to LEFT
- ▶ analysis of LHC + lower-E results

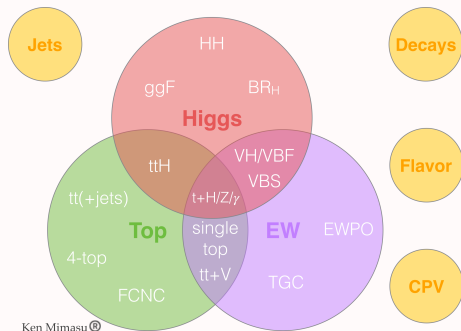

Combine, combine, combine

2499 parameters in the most general case

- can be reduced
 - ▶ assuming symmetries: flavor, CP
 - ▶ taking advantage of kinematic suppressions

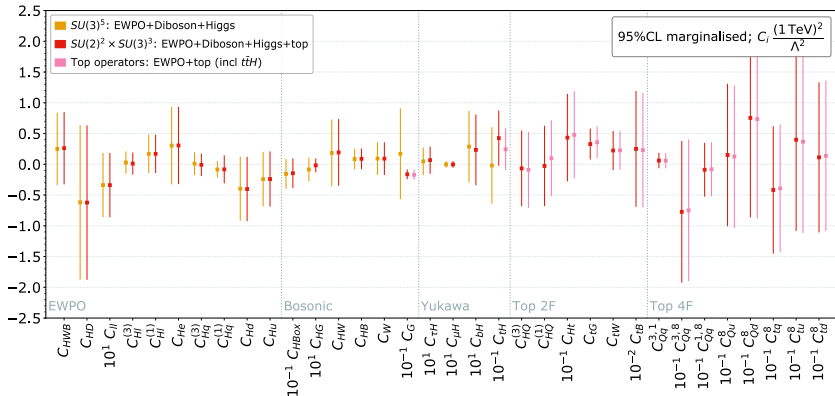

beyond this **combining**
different measurements is necessary

- ▶ to access as many operators as we can
- ▶ to avoid bias in interpretation
i.e. miss a potential deviation or
assign it to the wrong op.

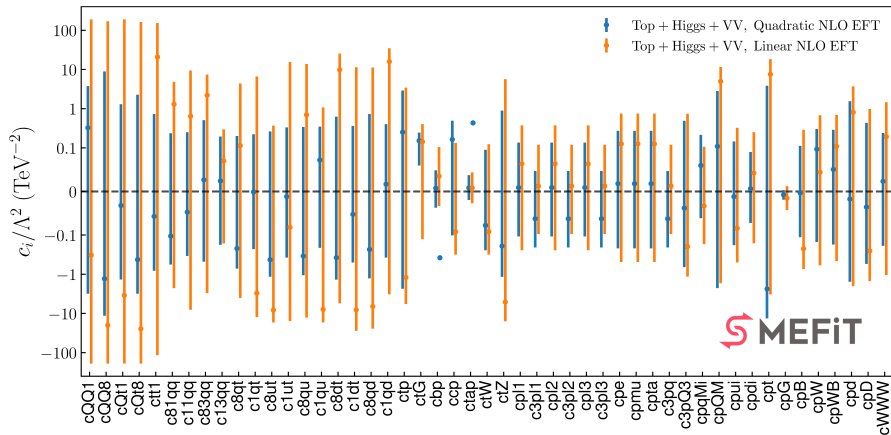

State-of-the-art SMEFT fits: H + EW + Top

Ellis, Madigan, Mimasu, Sanz, You 2012.02779

34 param, $U(3)^5$ flavor sym, linear, LO + ggH

State-of-the-art SMEFT fits: H + EW + Top

Ethier, Maltoni, Mantani, Nocera, Rojo 2105.00006

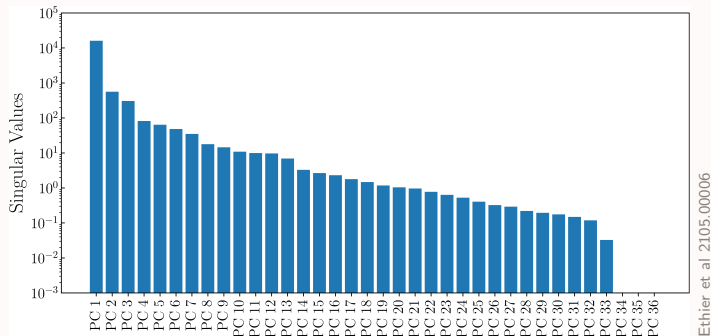

50 param (36 indep.), $U(2)^2 \times U(3) \times U(1)^3$ flavor sym, linear+quadratic, NLO QCD

SMEFT fits: typical features

- ▶ many **dimensions**: state-of-the-art 30–35 LHC target (EW+H+top) ~ 50

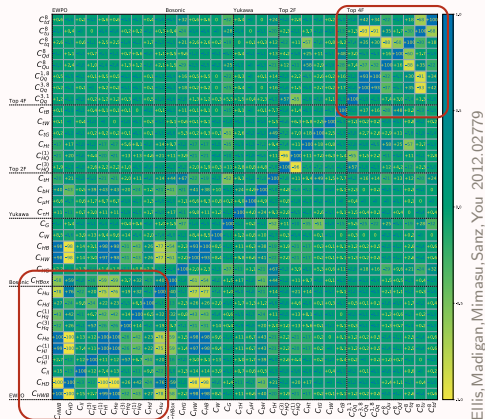

SMEFT fits: typical features

- ▶ many **dimensions**: state-of-the-art 30–35 LHC target (EW+H+top) ~ 50
- ▶ large **hierarchies** between constraints (easily 2 – 5 orders of magnitude)

SMEFT fits: typical features

- ▶ many **dimensions**: state-of-the-art 30–35 LHC target (EW+H+top) ~ 50
- ▶ large **hierarchies** between constraints (easily 2 – 5 orders of magnitude)
- ▶ weakly broken flat directions \rightarrow highly **correlated** sub-spaces

SMEFT fits: typical features

- ▶ many **dimensions**: state-of-the-art 30–35 LHC target (EW+H+top) ~ 50
- ▶ large **hierarchies** between constraints (easily 2 – 5 orders of magnitude)
- ▶ weakly broken flat directions \rightarrow highly **correlated** sub-spaces
- ▶ high sensitivity to **uncertainties** size and correlations

SMEFT fits: typical features

- ▶ many **dimensions**: state-of-the-art 30–35 LHC target (EW+H+top) ~ 50
- ▶ large **hierarchies** between constraints (easily 2 – 5 orders of magnitude)
- ▶ weakly broken flat directions \rightarrow highly **correlated** sub-spaces
- ▶ high sensitivity to **uncertainties** size and correlations

Results derived in different setups to understand the structure of the fit space

- ▶ linear \leftrightarrow linear + quadratics
- ▶ LO \leftrightarrow NLO
- ▶ individual \leftrightarrow marginalised/profiled
- ▶ comparisons between different fitting methods
- ▶ Fisher information
- ▶ Principal Component Analysis
- ▶ sub-fits to check impact of individual datasets

What's missing for a successful SMEFT program?

[personal/pragmatic point of view, not attempting to make a complete list.]

A = for being sensitive

B = for interpreting deviations correctly

0. (experimentally established anomalies)
1. **A** reduction of uncertainties on SM predictions + systematics
2. **A** **B** streamline treatment & reduction of EFT-born uncertainties
3. **B** correct treatment of correlations → involvement of experiments
Bißmann, Erdmann, Grunwald, Hiller, Kröninger 1912.06090
4. **B** including SMEFT beyond ME: PDF, PS, acceptances
Carrazza et al 1905.05215, Greljo et al. 2104.02723, Iranipour, Ubiali 2201.07240
Goldouzian et al 2012.06872, Haisch et al 2204.00663, ATL-PHYS-PUB-2022-037
5. **B** more refined process treatment: exploit differential info, target ~~CP~~, flavor...
6. **B** handling & understanding ~ 50-dimensional likelihoods

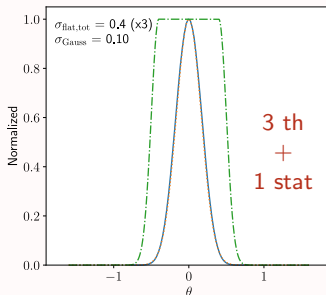

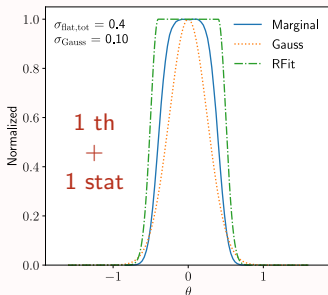

Marginalisation

→ already used in HEPfit, SMEFTfit, EFTfitter...

deBlas et al 1905.03764, Ethier et al 2105.00006,
Castro et al 1605.05585

compared to Profiling: **more convenient for large-dimensional fits**

- ▶ not the same interpretation! but results should be close to each other when many measurements and uncertainties are included (central limit thm)
- ▶ applied on nuisance par. to combine uncertainties on individual measurements + on SMEFT par. to obtain 1D or 2D likelihoods
- ▶ main difference: **uncertainty treatment**

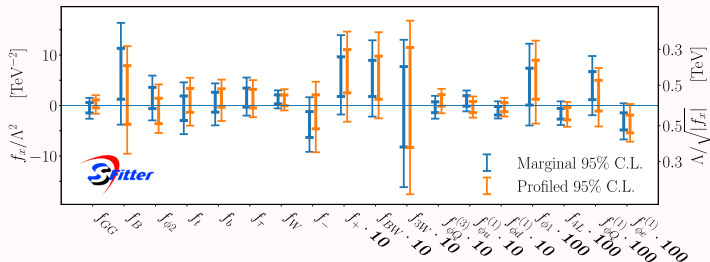

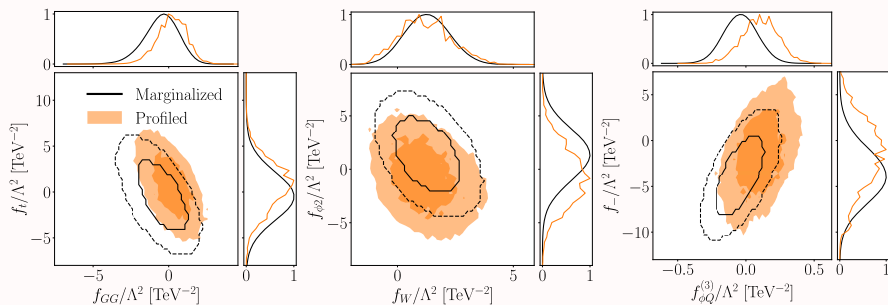

IB, Bruggisser, Elmer, Geoffray,
Luchmann, Plehn 2208.06454

- ▶ faster convergence to Gaussian shape \Rightarrow way less computationally expensive

Marginalisation - 18D fits

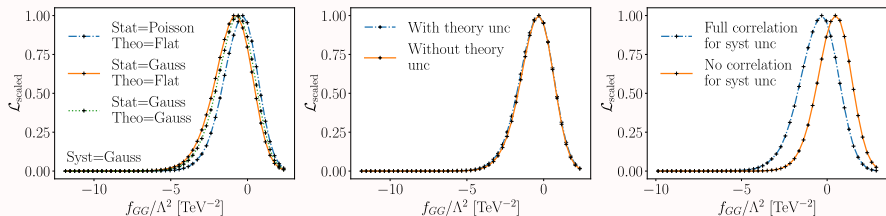

IB, Bruggisser, Elmer, Geoffray, Luchmann, Plehn 2208.08454

Marginalisation: the role of correlations

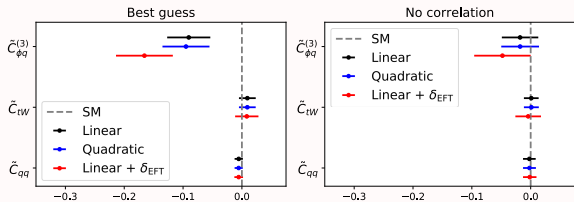

when marginalising over (many) nuisance parameters,
it is not so relevant whether they are originally modeled as flat, poisson or Gauss

the largest difference is seen changing **correlations**

observed also in

Bißmann, Erdmann, Grunwald,
Hiller, Kröninger 1912.06090

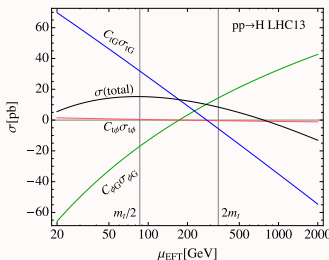

Theory uncertainties on EFT predictions

$$\sigma_{SMEFT} = \sigma_{SM} [1 + a_i C_i + b_{ij} C_i C_j + \dots]$$

$$a_i = a_i^0 \pm \Delta a_i$$

- ▶ uncertainties from dependence on SM quantities (eg. input schemes, scales), from MC simulations ...
- ▶ uncertainties due to **running & mixing** coefficients (EFT scale)

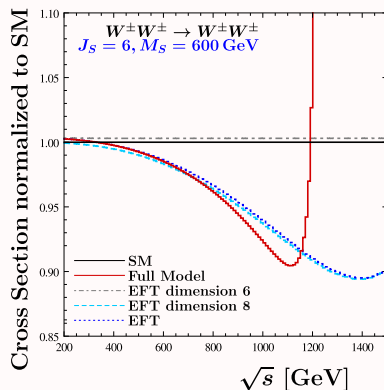

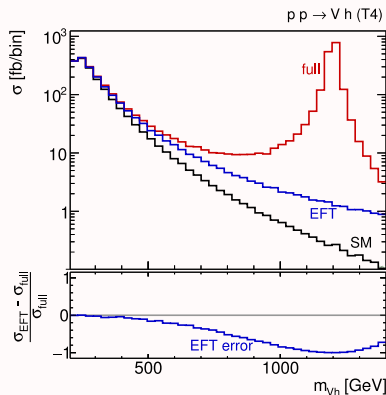

Maltoni, Vryonidou, Zhang
1607.05330

- ▶ uncertainties due to missing **higher orders in loops** (QCD/EW)
- ▶ uncertainties due to **missing higher EFT orders** / unknown cutoff size

Impact of higher order operators

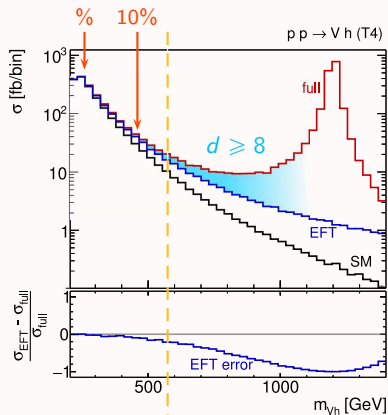

EFT obtained from matching to full model

adapted from
 Lang, Liebler, Schäfer-Siebert, Zeppenfeld 2103.16517

Impact of higher order operators

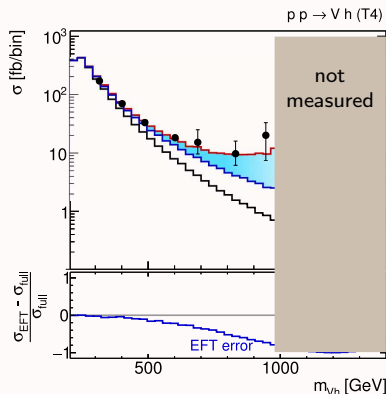

EFT obtained from matching to full model

$d = 6$ breaks down

Impact of higher order operators

EFT obtained from matching to full model

top-down: C_i fixed by matching
→ EFT not valid in high-E region

bottom-up: fit C_i to data
tends to make EFT match full result
→ find wrong values of C_i

how to keep this into account?

sliding upper cut:

Contino, Falkowski, Goertz,
Grojean, Riva 1604.06444

uncertainty band:

Trott et al 1508.05060, 2007.00565, 2106.13794
Hays, Martin, Sanz, Setford 1808.00442
Shepherd et al 1812.07575, 1907.13160

compute at $O(\Lambda^{-4})$

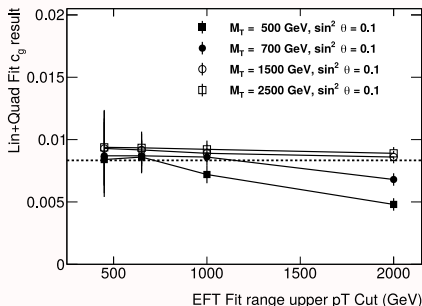

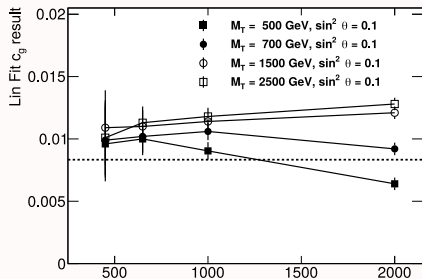

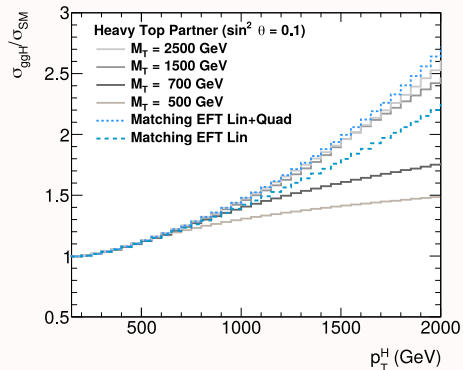

Boghezal, Mereghetti, Petriello 2106.05337
Asteriadis, Dawson, Fontes, Homiller, Sullivan
2110.06929, 2205.01561, 2212.03258

Benchmarking these proposals: sliding upper cut

Battaglia, Grazzini, Spira, Wiesenmann 2109.02987

p_T^H from heavy top partner

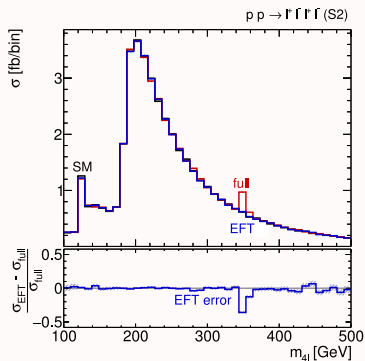

fit result $\stackrel{?}{=}$ value from matching
 \rightarrow check impact of upp. cut + quadratics

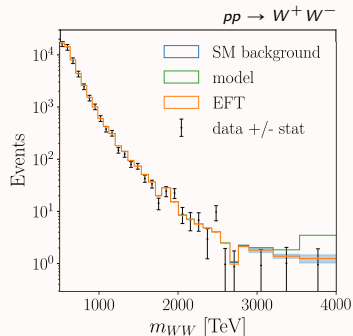

safe scenarios \leftrightarrow no energy growth \leftrightarrow small effects

typical cases where $d = 6$ works well **across the whole visible spectrum**:

- ▶ observables w/o E dependence ($1 \rightarrow 2$ decays)
- ▶ BSM scenarios with very narrow and/or heavy states

adapted from
Brehmer, Freitas, López-Val, Plehn 1510.03443

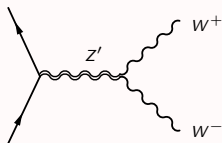

Brivio, Bruggisser, Geoffroy, Kilian, Krämer,
Luchmann, Plehn, Summ 2108.01094

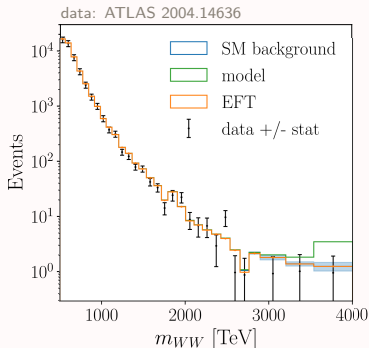

price to pay: % effects only
 \rightarrow most sensitivity from lowest error region (\sim bulk)

Interplay with direct searches

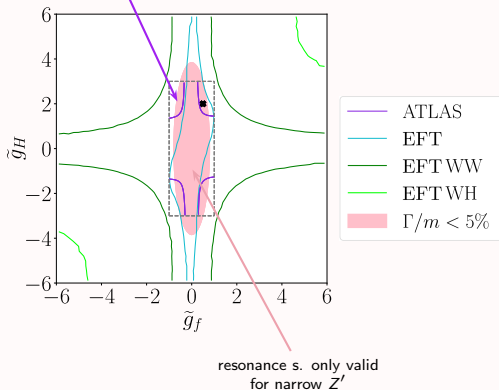

IB, Bruggisser, Geoffray, Kilian, Krämer,
Luchmann, Plehn, Summ 2108.01094

$$m_{Z'} = m_V = 4 \text{ TeV}$$

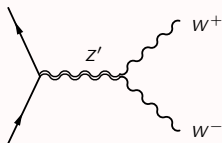

bound from
WW resonance search

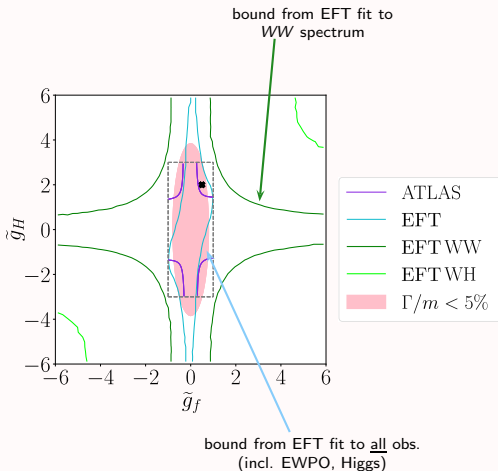

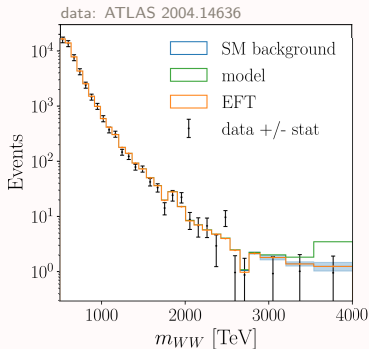

Interplay with direct searches

IB, Bruggisser, Geoffray, Kilian, Krämer,
Luchmann, Plehn, Summ 2108.01094

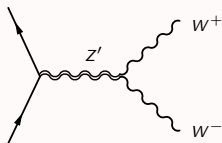

$$m_{Z'} = m_V = 4 \text{ TeV}$$

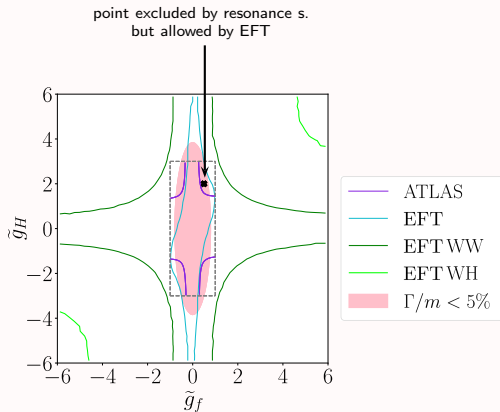

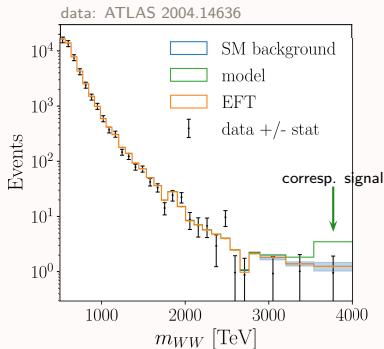

Interplay with direct searches

IB, Bruggisser, Geoffroy, Kilian, Krämer,
Luchmann, Plehn, Summ 2108.01094

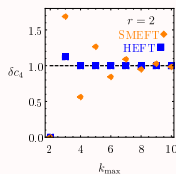

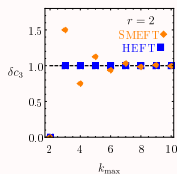

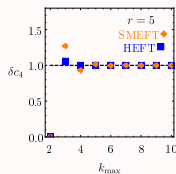

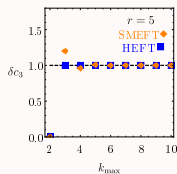

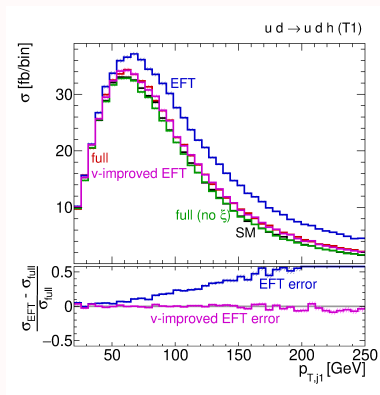

$$m_{Z'} = m_V = 4 \text{ TeV}$$

SMEFT or HEFT?

a component of the $d = 6$ vs model discrepancy can be removed by reabsorbing higher powers of v within $d = 6$ coefficients instead of leaving them to $d \geq 8$

conceptually similar to using **HEFT** instead

Brehmer, Freitas, López-Val, Plehn 1510.03443

Cohen, Craig, Lu, Sutherland 2008.08597

which EFT is most convenient?

Non-resonant signals beyond SMEFT

NP assumptions

H doublet ✓ = Higgs $SU(2)$ doublet structure recovered

~~light NP~~
($\lesssim 100$ GeV)

SMEFT	

Non-resonant signals beyond SMEFT

NP assumptions

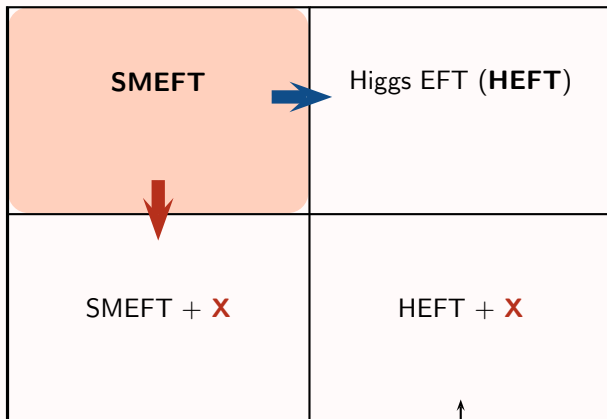

H doublet ✓

H ~~doublet~~

~~light NP~~
($\lesssim 100$ GeV)

✓ light NP

✗ = axions, ALPs, HNL,
dark γ , DM...

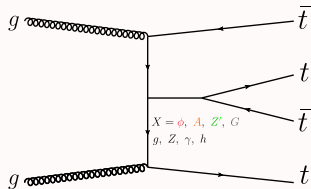

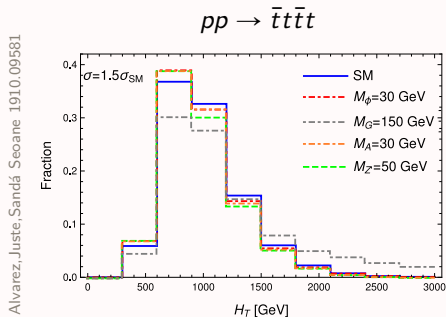

Higgs SU(2) doublet structure
badly or not at all recovered at low E

Non-SMEFT non-resonant signals: light NP

Non-resonant signals can also be induced by new **light** states

→ off-shell, in the limit $\sqrt{s} \gg m$ → typically happens for heavy final states

→ most relevant if they have momentum-enhanced couplings (EFT)

graviton **G** has $d = 5$ coupling ($G_{\mu\nu} \bar{t}_R \gamma^\mu D^\nu t_R$), all others are $d = 4$

top-philic → not ruled out by direct searches

An interesting case: Axion-Like Particles

ALP = pseudo-Goldstone boson from breaking of BSM symmetry

Examples:

Peccei-Quinn symm.	→	QCD axion	Peccei,Quinn 1977, Weinberg 1978 Wilczek 1978
Lepton number	→	Majoron	Gelmini,Roncadelli 1981 Langacker,Peccei,Yanagida 1986
Flavor symm.	→	Flavon	Wilczek 1982

Fundamental properties

- ▶ neutral, pseudo-scalar: spin 0, odd parity
- ▶ approx. shift symmetry $a(x) \rightarrow a(x) + c \Rightarrow m_a$ **naturally small**

Why so interesting?

- ▶ naturally the lightest remnant of heavy NP sectors → easiest to discover
- ▶ spontaneous symmetry breakings are **ubiquitous** in BSM → high relevance
- ▶ under certain conditions: good **DM** candidate

ALP Effective Field Theory

- ▶ ALPs can be described in a **EFT** where heavy sector is integrated out
- ▶ SM fields + a & SM symmetries + ALP shift sym. (+ CP)
- ▶ Cutoff: f_a (ALP char. scale, reminiscent of f_π). LO: dimension 5

CP even: Georgi, Kaplan, Randall PLB169B(1986)73

$$\begin{aligned}\mathcal{L}_{ALP} = & \frac{1}{2} \partial_\mu a \partial^\mu a - \frac{m_a^2}{2} a^2 \\ & + C_{\tilde{B}} O_{\tilde{B}} + C_{\tilde{W}} O_{\tilde{W}} + C_{\tilde{G}} O_{\tilde{G}} \\ & + C_u O_u + C_d O_d + C_e O_e + C_Q O_Q + C_L O_L + \mathcal{O}(f_a^{-2})\end{aligned}$$

$$\begin{aligned}O_{\tilde{B}} &= -\frac{a}{f_a} B_{\mu\nu} \tilde{B}^{\mu\nu} & O_{\tilde{W}} &= -\frac{a}{f_a} W_{\mu\nu}^I \tilde{W}^{I\mu\nu} & O_{\tilde{G}} &= -\frac{a}{f_a} G_{\mu\nu}^A \tilde{G}^{A\mu\nu} \\ O_{f,ij} &= \frac{\partial^\mu a}{f_a} (\bar{f}_i \gamma^\mu f_j) & \rightarrow C_f : & N_g \times N_g \text{ symmetric matrices in flavor space}\end{aligned}$$

Recent developments in ALP EFT

relatively simple EFT \rightarrow convenient theory playground
recently borrowed some expertise from SMEFT

ALPs at the LHC

Why?

- ▶ tree-level access to **couplings to heavy SM particles** (W, Z, h, t)
- ▶ access to **heavy ALPs** ($m_a \gtrsim 10$ s GeV)

How?

Non-resonant ALP signals at LHC

$ZZ, \gamma\gamma, t\bar{t}$: Gavela, No, Sanz, Troconiz 1905.12953, CMS PAS B2G-20-013 2111.13669

$WW, Z\gamma$: Carrá, Goumarre, Gupta, Heim, Heinemann, Küchler, Meloni, Quilez, Yap 2106.10085

ALP off-shell for $m_a \ll m_1 + m_2 \leq \sqrt{s}$ “too light to be resonant”

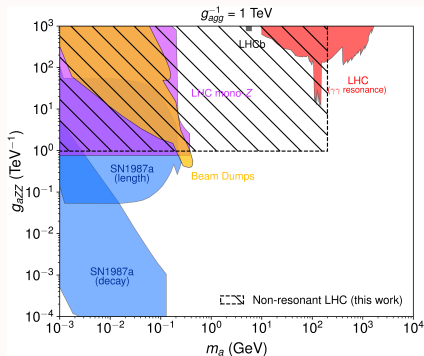

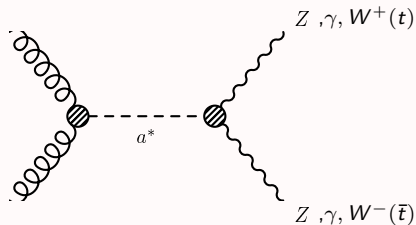

independent of m_a, Γ_a

Non-resonant ALP signals at LHC

$ZZ, \gamma\gamma, t\bar{t}$: Gavela, No, Sanz, Troconiz 1905.12953, CMS PAS B2G-20-013 2111.13669

$WW, Z\gamma$: Carrá, Goumarre, Gupta, Heim, Heinemann, Küchler, Meloni, Quilez, Yap 2106.10085

ALP off-shell for $m_a \ll m_1 + m_2 \leq \sqrt{s}$ “too light to be resonant”

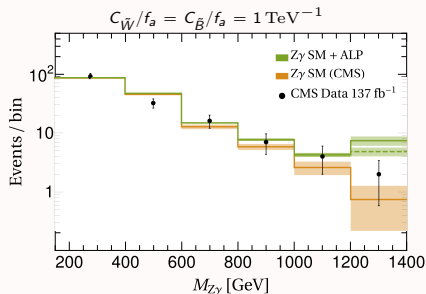

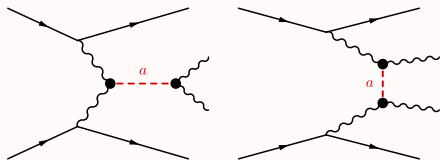

puts a constraint on $(g_{aGG} \times g_{aVV})$ product
for g_{aGG} not too small, competitive bounds on g_{aVV}

Non-resonant searches in VBS

Bonilla, IB, Machado-Rodríguez, Trocóniz 2202.03450

same principle, applied to Vector Boson Scattering

- independent of g_{aGG} (if pure ALP signal dominates, adding $C_{\tilde{G}}$ does not worsen bounds)
- compare to actual analyses by CMS: $W^\pm W^\pm$, $W^\pm Z$, $W^\pm \gamma$, $Z\gamma$, ZZ

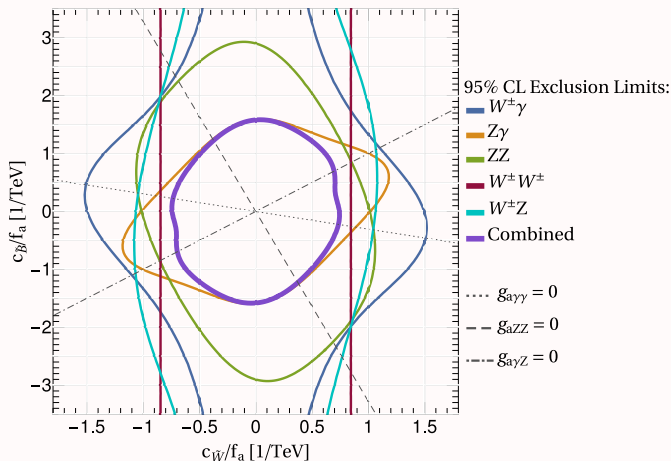

$$\sigma = \sigma_{SM} + \sigma_{\text{int.}}/f_a^2 + \sigma_{ALP}/f_a^4$$

$$\sigma_{\text{int.}} = C_{\tilde{B}}^2 \sigma_{B2} + C_{\tilde{W}}^2 \sigma_{W2} + C_{\tilde{B}} C_{\tilde{W}} \sigma_{WB}$$

$$\sigma_{ALP} = C_{\tilde{B}}^4 \sigma_{B4} + C_{\tilde{W}}^4 \sigma_{W4} + C_{\tilde{B}}^2 C_{\tilde{W}}^2 \sigma_{W2B2} + C_{\tilde{B}}^3 C_{\tilde{W}} \sigma_{B3W} + C_{\tilde{B}} C_{\tilde{W}}^3 \sigma_{BW3}$$

Non-resonant searches in VBS: Run 2 results

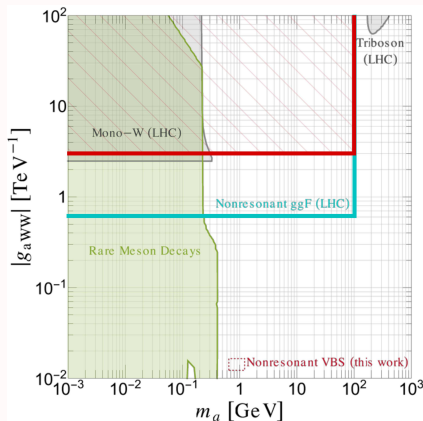

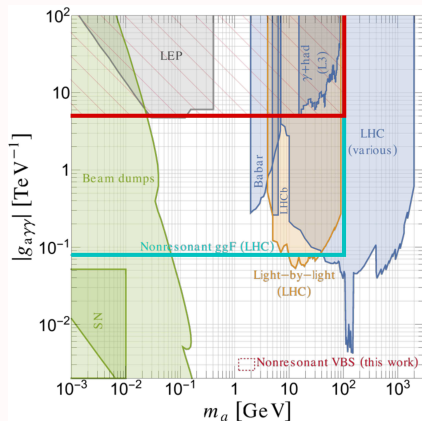

gauge invariant param. \rightarrow all EW couplings simultaneously accounted for

Comparison with other constraints

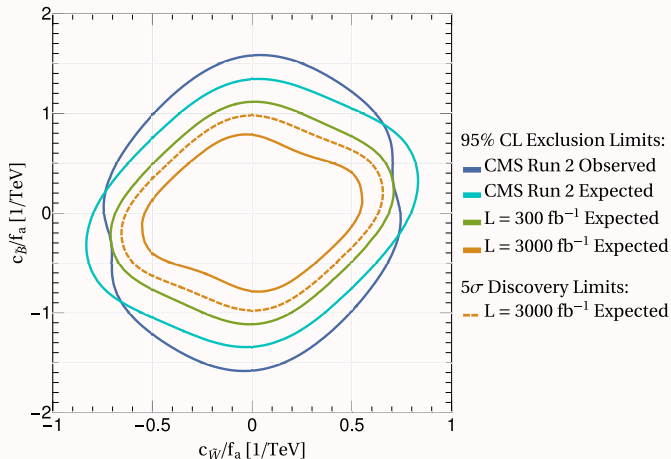

main values

- ▶ strongest bound on g_{aZZ} , g_{aWW} for $m_a \in [0.1, 100]$ GeV
 - ▶ independent of $C_{\tilde{G}}$
 - ▶ independent of m_a, Γ_a as long as $<$ threshold
- } relevant to break flat directions

Non-resonant searches in VBS: projections

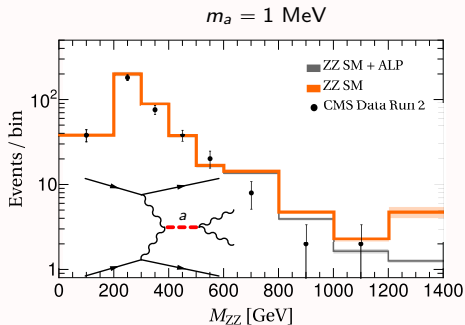

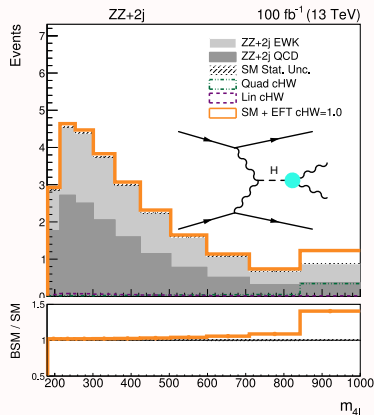

HL-LHC: sensitivity improves $\times 5 - 8$ on $XS \rightarrow \times 1.5 - 1.7$ on C_i/f_a

SMEFT vs ALPs in VBS

$pp \rightarrow jjZZ$ in SMEFT

$pp \rightarrow jjZZ$ with an ALP

Summary

- 
- ▶ **Non-resonant signals** are a main target for the LHC in the future runs
 - ▶ SMEFT is the default choice for a global program
 - ▶ Enormous improvements made, some (technical) challenges still ahead
 - ▶ **Alternative EFTs** are also good candidates for a BSM interpretation
 - ▶ Non-resonant signals interesting also for **light NP**
e.g. top-philic bosons, ALPs... \rightarrow relevant at $\sqrt{s} \gg m$
 - ▶ Distinguishing SMEFT / HEFT / other sources is an open challenge
-
