

Update on Tracking Studies using JANA2 Framework

Shyam Kumar, Annalisa Mastroserio, Domenico Elia
University and INFN Bari, Italy

Thanks to Dimitry Romanov (Jefferson Lab) and Shujie for the discussion

➤ EPIC Geometry

- epic_brycecanyon
- EPIC Barrel Configuration (used in fast simulation)
- Material Map

➤ Basic Performances

- Hit Points
- Estimation of Minimum p_T
- Acceptance: Eta vs momentum maps (sim/rec)

➤ Tracking Performances

- Efficiency/Acceptance (Truth seeding)
- Momentum Resolution
- Pointing Resolution

Study by Wenqing based on Juggler and epic_tracking_only geometry

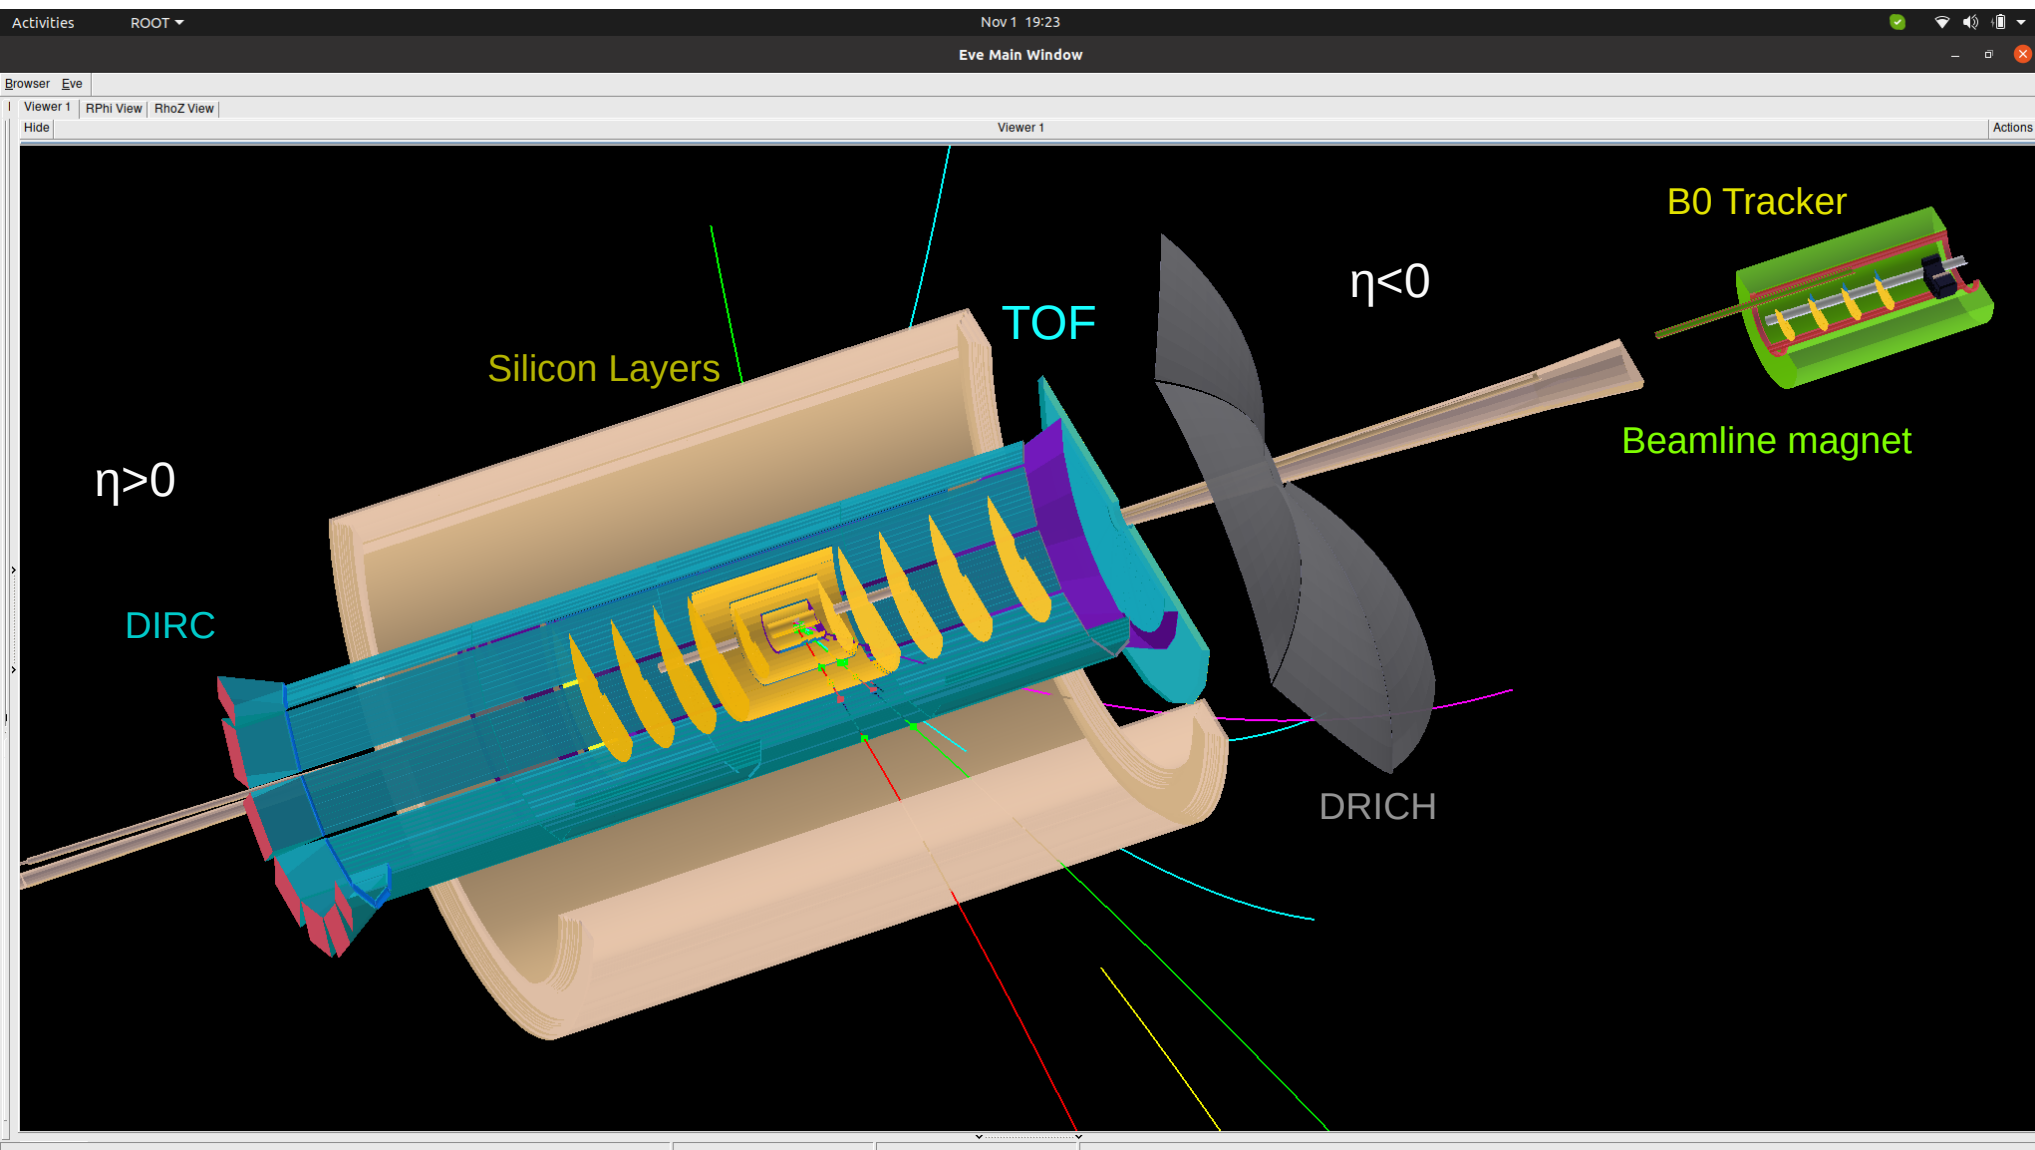

https://indico.bnl.gov/event/17348/contributions/69177/attachments/43845/73961/ePIC_tracking_wenqing_beatrice_101322.pdf

➤ Summary and Future Plan

[Physics requirements taken from link below](#)

Estimation of Minimum p_T

Third layer

$$p_T = 0.3 \text{ B [T]} R[\text{m}] = (0.3 \cdot 1.7 \cdot 0.12)/2 = 0.0306 \text{ GeV/c}$$

Track $p_T = 0.0310$ (GeV/c)

Beam Pipe: $r = 3.18$ cm
Vtx: $r = 3.60, 4.80, 12.00$ cm
Barrel: $r = 27.00, 42.00$ cm
Support: $r = 13.50$ cm
TOF-LGAD: $r = 64.00$ cm
MPGD: $r = 51.00$ cm

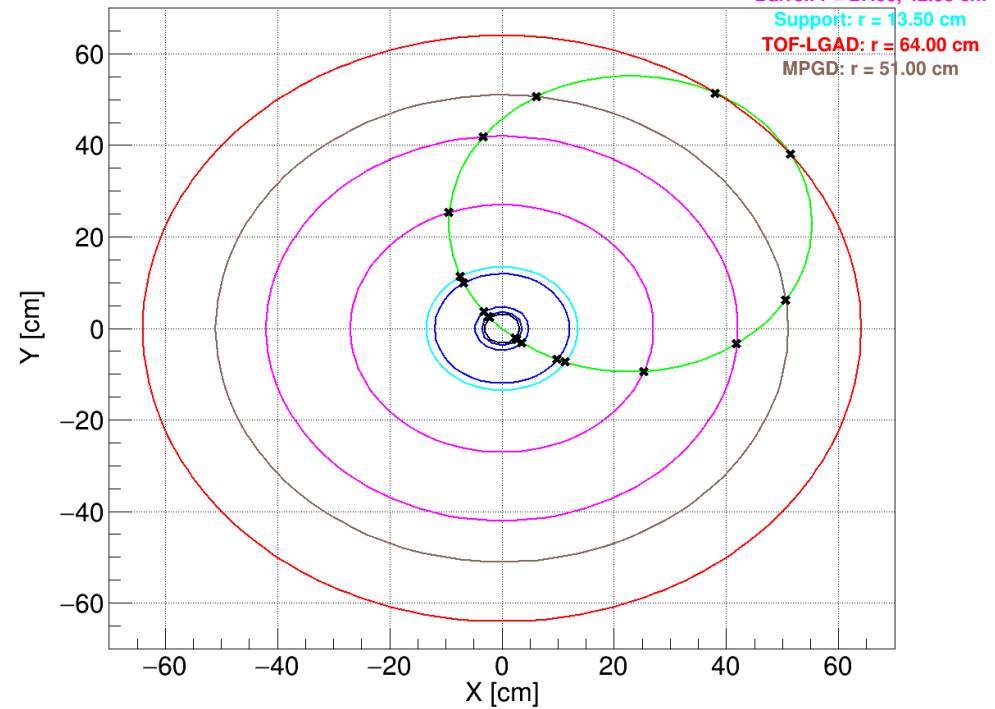

Last layer

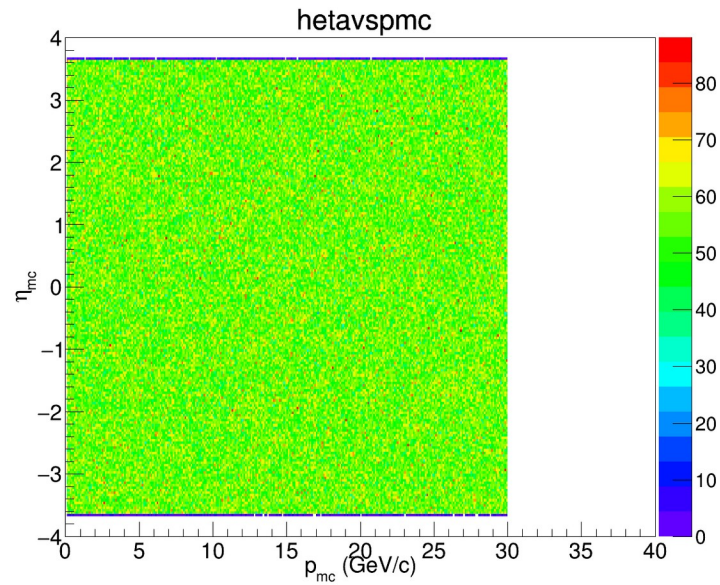

$$p_T = (0.3 \cdot 1.7 \cdot 0.64)/2 = 0.1632 \text{ GeV/c}$$

Track $p_T = 0.1650$ (GeV/c)

Beam Pipe: $r = 3.18$ cm
Vtx: $r = 3.60, 4.80, 12.00$ cm
Barrel: $r = 27.00, 42.00$ cm
Support: $r = 13.50$ cm
TOF-LGAD: $r = 64.00$ cm
MPGD: $r = 51.00$ cm

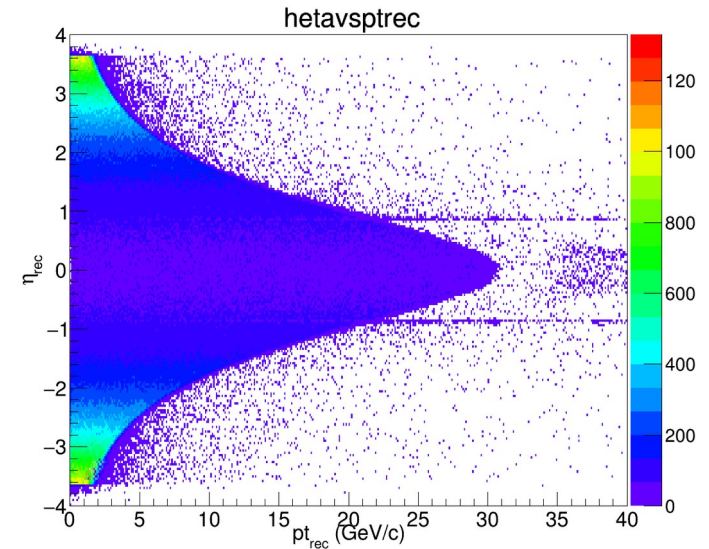

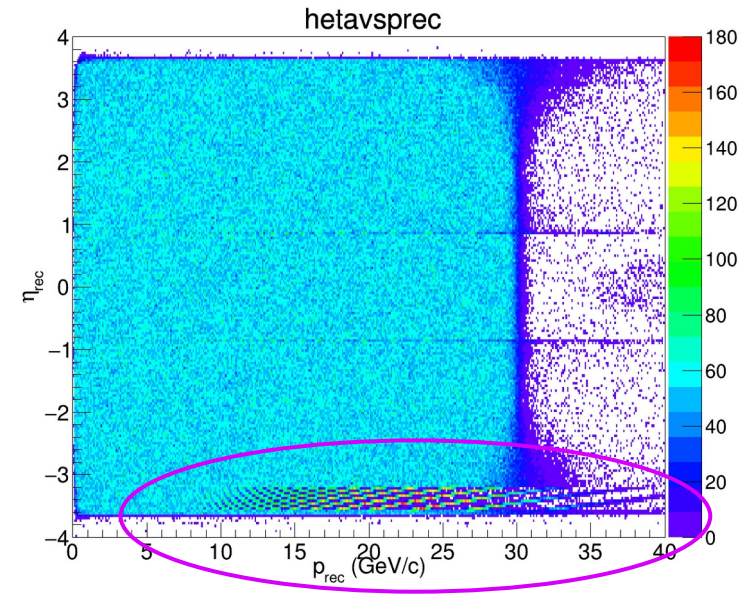

Acceptance: Eta vs momentum maps (sim/rec)

epic_brycecanyon.xml

3M pi+ [0.1-30. GeV/c]

Structures in Reco Momentum

100 k pi+ [0.1,30 GeV/c]

Removed far forward and far backward detectors

uses the beampipe to help define its placement.

The IP subsystems include the Far forward and backward regions. The list of subsystem includes:

- Interaction region beampipe
- B0 tracker
- Off-momentum tracker
- Far forward roman pots
- Zero Degree Calorimeter
- Beam line magnets.
- and more...

Need to be understood

Efficiency/Acceptance (Truth seeding)

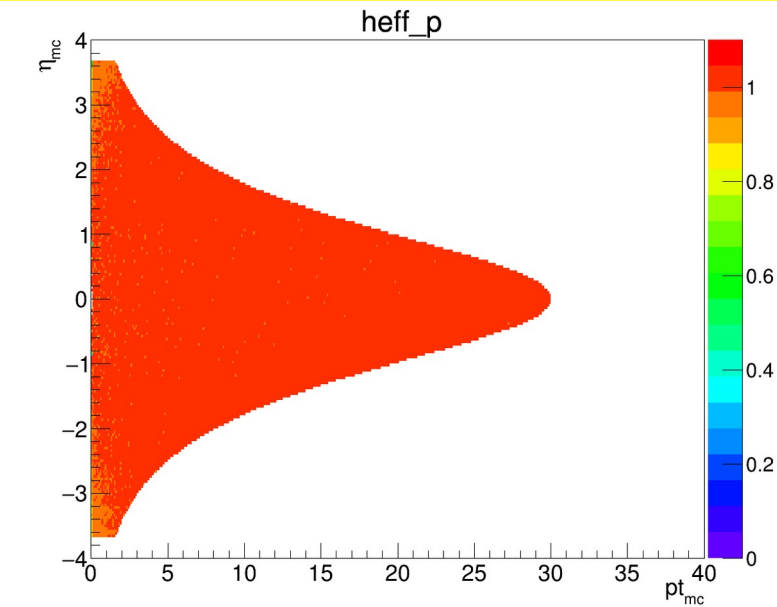

3M pi+ [0.1-30. GeV/c]

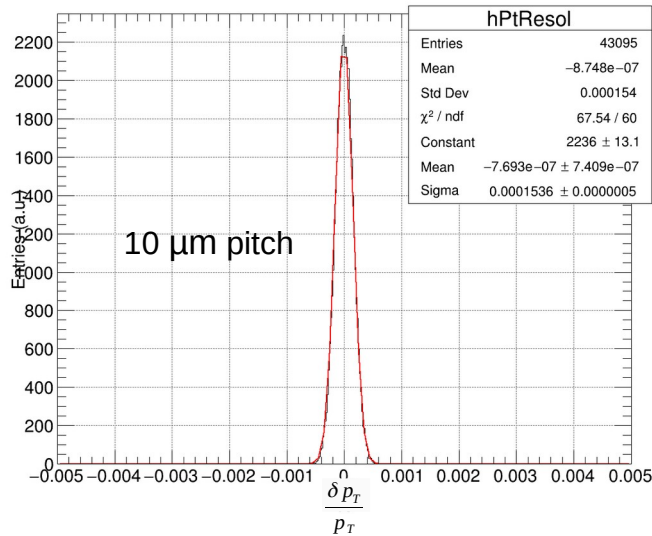

- Acceptance vs momentum
- Acceptance is looking good
- Still to be checked the number of hits and Chi2 as suggested

Efficiency/Acceptance (Truth seeding)

- Acceptance vs transverse momentum
- Acceptance is looking good
- Still to be checked the number of hits and Chi2 as suggested

Tracking Performances (Fast Simulation)

Changing pixel pitch of 10, 15, 20, 30 μm for Si layers (Barrel region)

Spatial Resolution only
No Multiple scattering

Fast sim developed by
S. Kumar, Annalisa,
F. Colamaria

DCA_{xy} Resolution

arXiv:1805.12014

r_0 : distance of near hit

L_0 : distance between near and farthest hit from the beamline

DCA_{xy} increases at larger η because r_0/L_0 increases

DCA_{xy} resolution:

$$\Delta d_0|_{res.} \approx \frac{3\sigma_{r\phi}}{\sqrt{N+5}} \sqrt{1 + \frac{8r_0}{L_0} + \frac{28r_0^2}{L_0^2} + \frac{40r_0^3}{L_0^3} + \frac{20r_0^4}{L_0^4}}$$

$$\Delta d_0|_{m.s.} \approx \frac{0.0136 \text{ GeV}/c}{\beta p_T} r_0 \sqrt{\frac{d}{X_0 \sin \theta}} \sqrt{1 + \frac{1}{2} \left(\frac{r_0}{L_0} \right) + \frac{N}{4} \left(\frac{r_0}{L_0} \right)^2}$$

(r_0/L_0) is very important for DCA_{xy} resolutions

$$\sigma_{d_0} = \sqrt{\sigma_{d_0,SR}^2 + \sigma_{d_0,MS}^2}$$

Barrel

$r_0 = 3.6$; $L_0 = 64.0-3.6$; $N = 7$;

$\sigma_{r\phi} = 10 \mu\text{m}/\sqrt{12}$

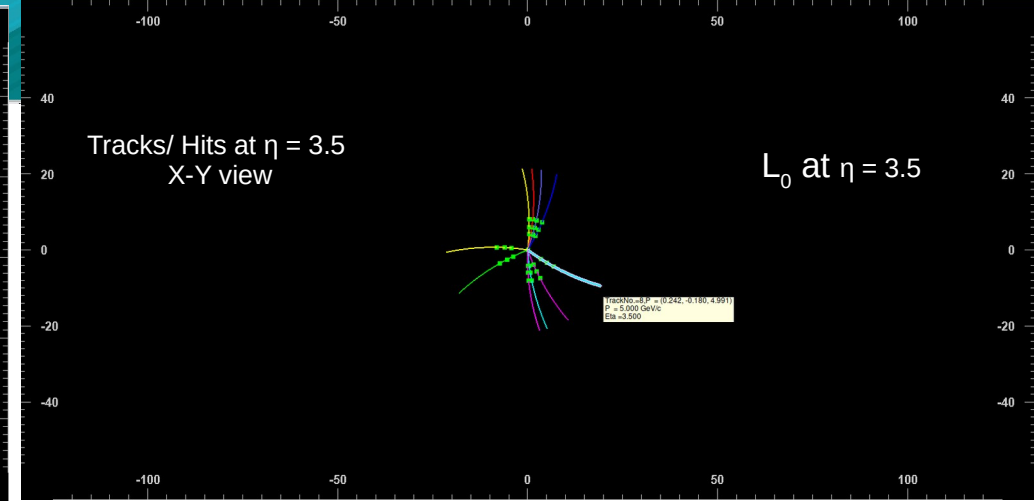

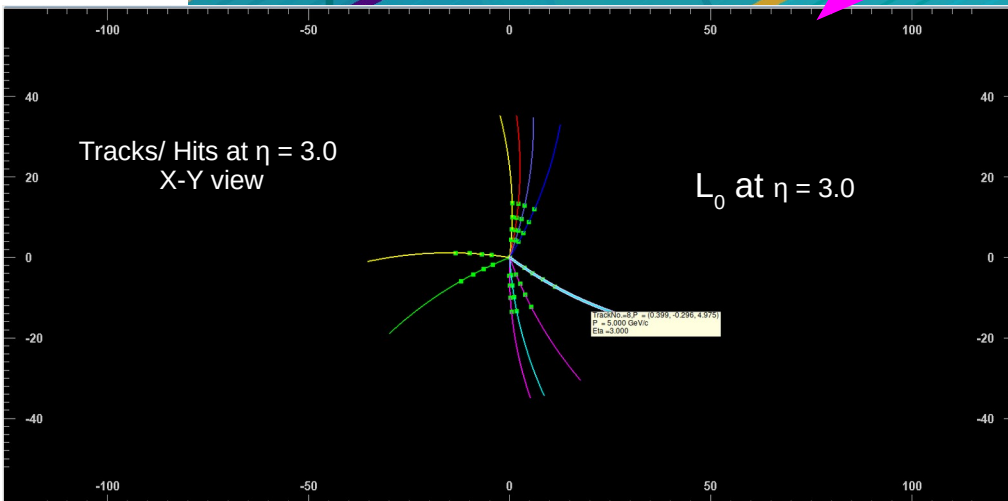

Expected DCAxy Resol Barrel (SR): 3.14743 μm

Forward/Backward

```
Double_t rmin[5] = {3.67617,3.67617,4.07617,5.37617,7.07617};
Double_t rmax[5] = {24.00010,42.500107,43.12010,43.12010,43.12010};
Double_t z[] = {25., 45., 70., 100., 135.};
Double_t L_0 = 43.12010-3.67617; N = 4; // number of points
sigma_rphi = 10 um/sqrt(12)
```

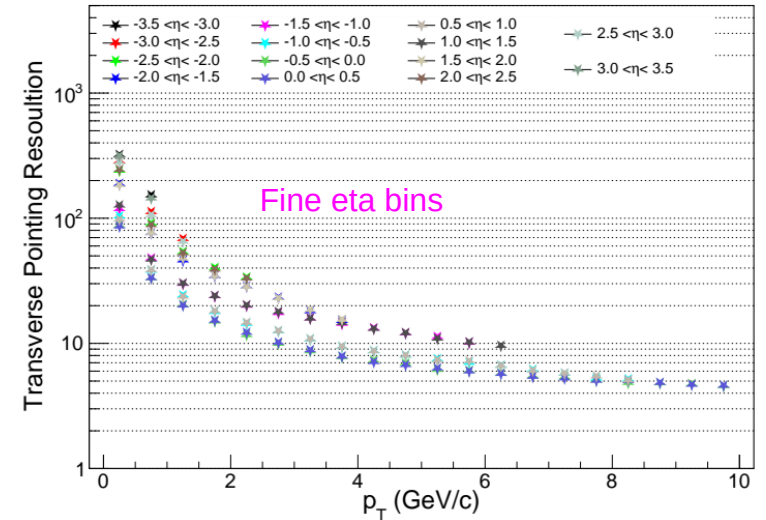

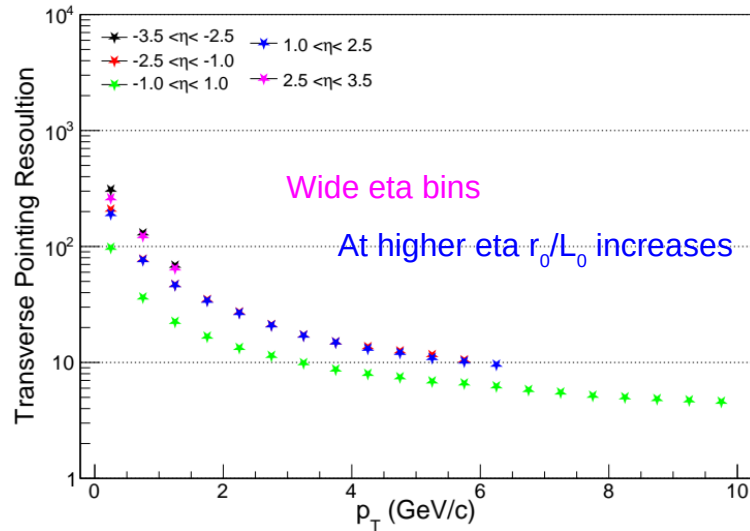

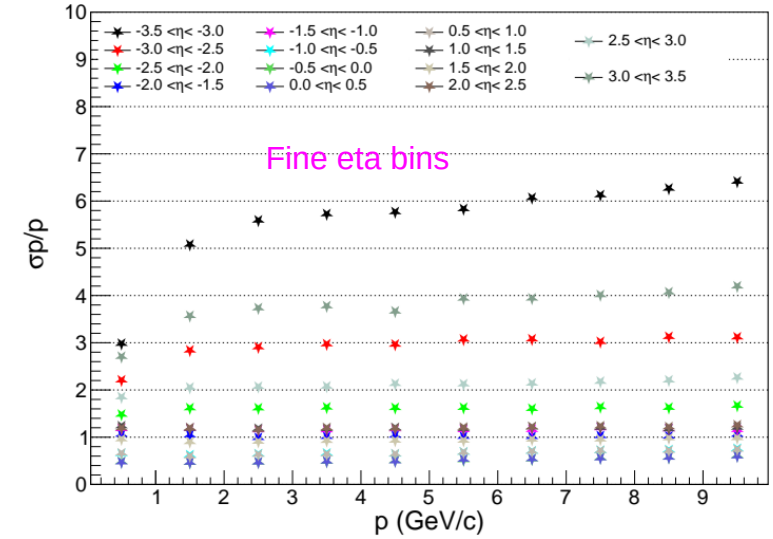

Expected DCAxy Resol Forward (SR): 4.10559 μm
if ($L_0 = 20\text{cm}$ then Expected DCAxy = 5.543 μm)

DCA_{xy} Resolution (Forward/Backward)

Summary and Future Plan

- Check the acceptance with truth seeding.
- Check at the first look of tracking performance and validation of fast simulation tool.
- Check the material map of the geometry component wise.
- Next
 - Number of hits per track, Chi^2/ndf
 - Started looking at the realistic seeding
 - Comparison with Juggler result is welcomed (by Wenqing)

Thank You !!!

Material Budget Plots

Tracking Performances

epic_brycecanyon.xml

Momentum Resolution

Zbynek Drasal, Werner Riegler

Tracking Performances: Momentum and DCA resolutions

Momentum Resolution: affects width of invariant mass peak

arXiv:1805.12014

p_T resolution:

$$\begin{aligned} \frac{\Delta p_T}{p_T} \Big|_{res.} &= \frac{\sigma_{r\phi} p_T}{0.3 B_0 L_0^2} \sqrt{\frac{720 N^3}{(N-1)(N+1)(N+2)(N+3)}} && \text{Linear term} \\ &\approx \frac{12 \sigma_{r\phi} p_T}{0.3 B_0 L_0^2} \sqrt{\frac{5}{N+5}} \\ \frac{\Delta p_T}{p_T} \Big|_{m.s.} &= \frac{N}{\sqrt{(N+1)(N-1)}} \frac{0.0136 \text{ GeV}/c}{0.3 \beta B_0 L_0} \sqrt{\frac{d_{tot}}{X_0 \sin \theta}} \left(1 + 0.038 \ln \frac{d}{X_0 \sin \theta} \right) \end{aligned}$$

Constant term (at $\beta < 1$ increase)

Based on Gluckstern Approach (equal distance between planes and equal spatial resolutions)

SR (Spatial Resolution): Uncertainty associated with finite size of pixels

MS (Multiple Scattering): Uncertainty associated with thickness of Material

$$\frac{\sigma_{p_T}}{p_T} = \sqrt{\left(\frac{\sigma_{p_T SR}}{p_T} \right)^2 + \left(\frac{\sigma_{p_T MS}}{p_T} \right)^2}$$

Simple Example

Consider an example of silicon layers of 50 μm thickness

$$r_0 = 2 \text{ cm} \quad L_0 = 7 - 2 = 5 \text{ cm};$$

$$\sigma_{r\phi} = 10 \mu\text{m}$$
