

epic - analysis

Common Analysis Framework for (SI)DIS and More

Christopher Dilks

ePIC Collaboration Meeting

January 2023

Research supported by the

U.S. DEPARTMENT OF
ENERGY

Office of
Science

Outline

◆ epic-analysis

- Support ePIC, ECCE, ATHENA, Delphes
- Data retrieval automation
- Kinematics Reconstruction
- Q^2 weighting

◆ Continuous Integration

- As a “slow” benchmark
- Comparisons

◆ Ongoing Plans

GitHub Repository

<https://github.com/eic/epic-analysis>

The screenshot shows the GitHub repository page for `eic / epic-analysis`. The repository is public. The navigation bar includes tabs for Code, Issues (16), Pull requests (7), Discussions, Actions, Projects (3), Wiki, Security, and Insights. Below the navigation bar, there are buttons for 'main' (selected), '20 branches', and '8 tags'. There are also buttons for 'Go to file', 'Add file', and 'Code'. The main content area displays a list of recent commits and files:

Commit/Directory	Description	Author	Time
c-dilks	ci: use relative resolution rather than absolute resolution (#230)	d24193c	last week
.github/workflows	ci: compare Arches and BryceCanyon, with and without radiative co...		last week
datagen	setup		last year
datarec	update comments to clarify HEPMC file paths		last month
deps	rename <code>sidis-eic</code> -> <code>epic-analysis</code> (#228)		2 weeks ago
doc	feat: update S3 endpoint (#221)		last month

Thanks to our Contributors

And many more for guidance and help!

History

◆ largex-eic

- Original focus on low-y region, large x and low Q2
- Generalized to support SIDIS studies in ATHENA

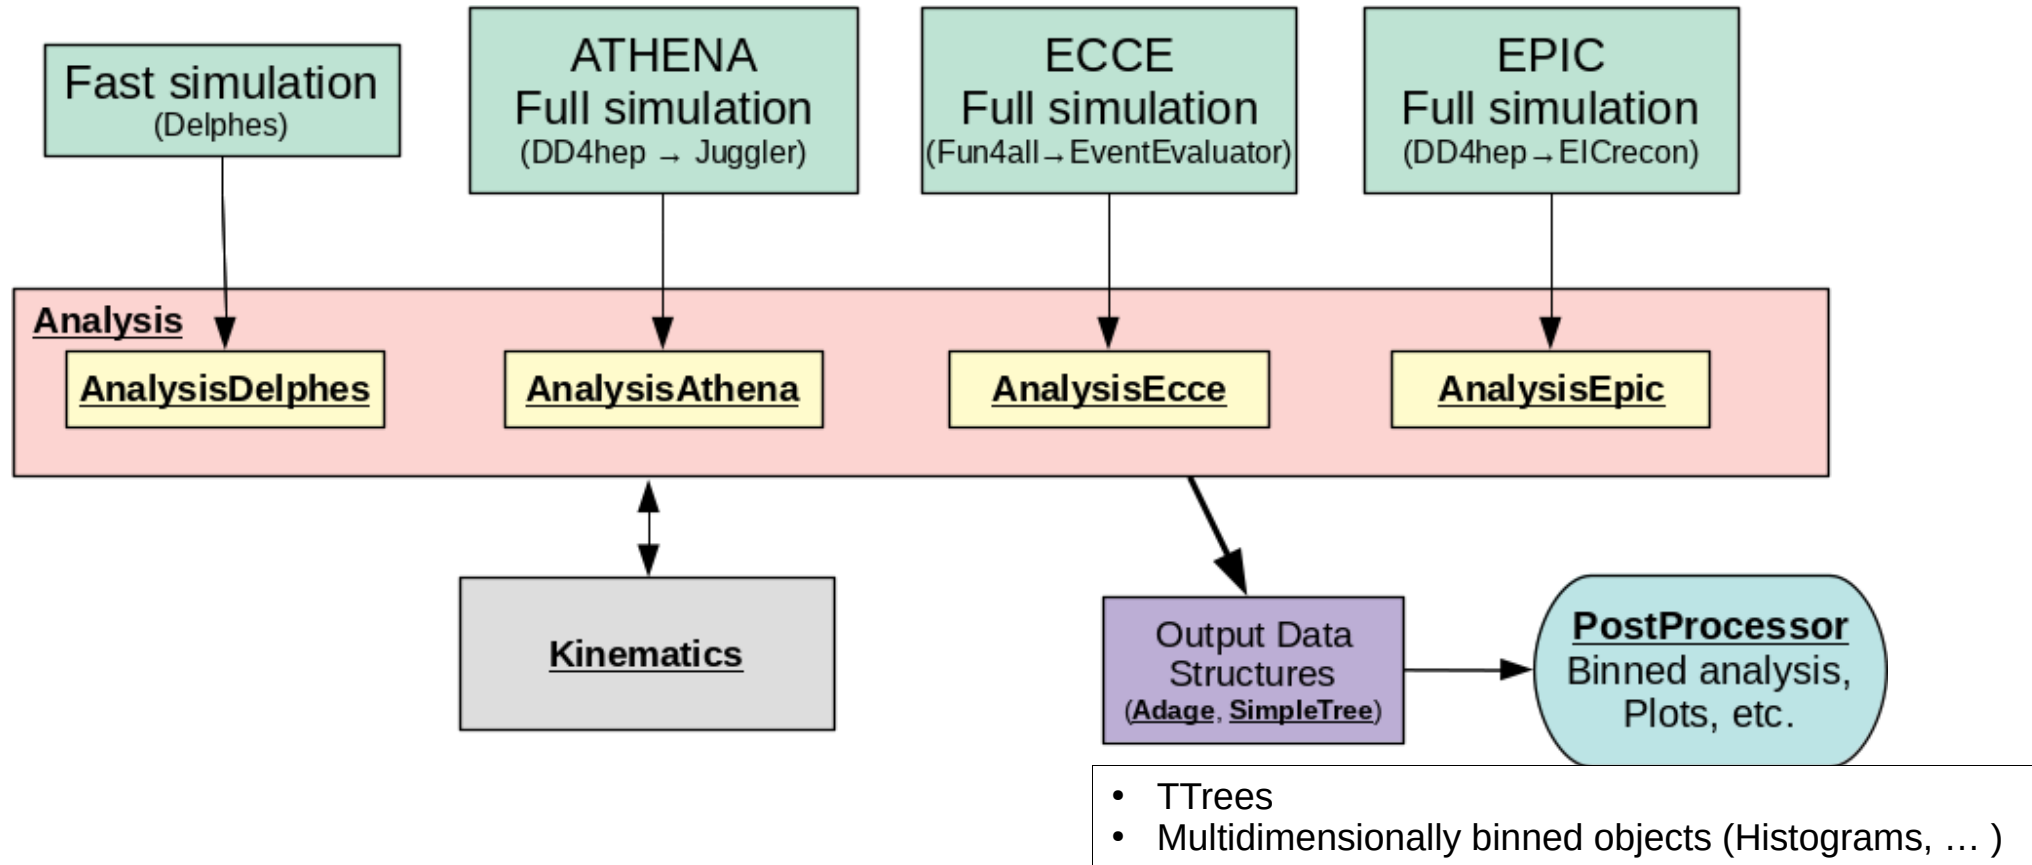

◆ sidis-eic

- Renamed for ePIC
- Migrated to the eic organization on GitHub

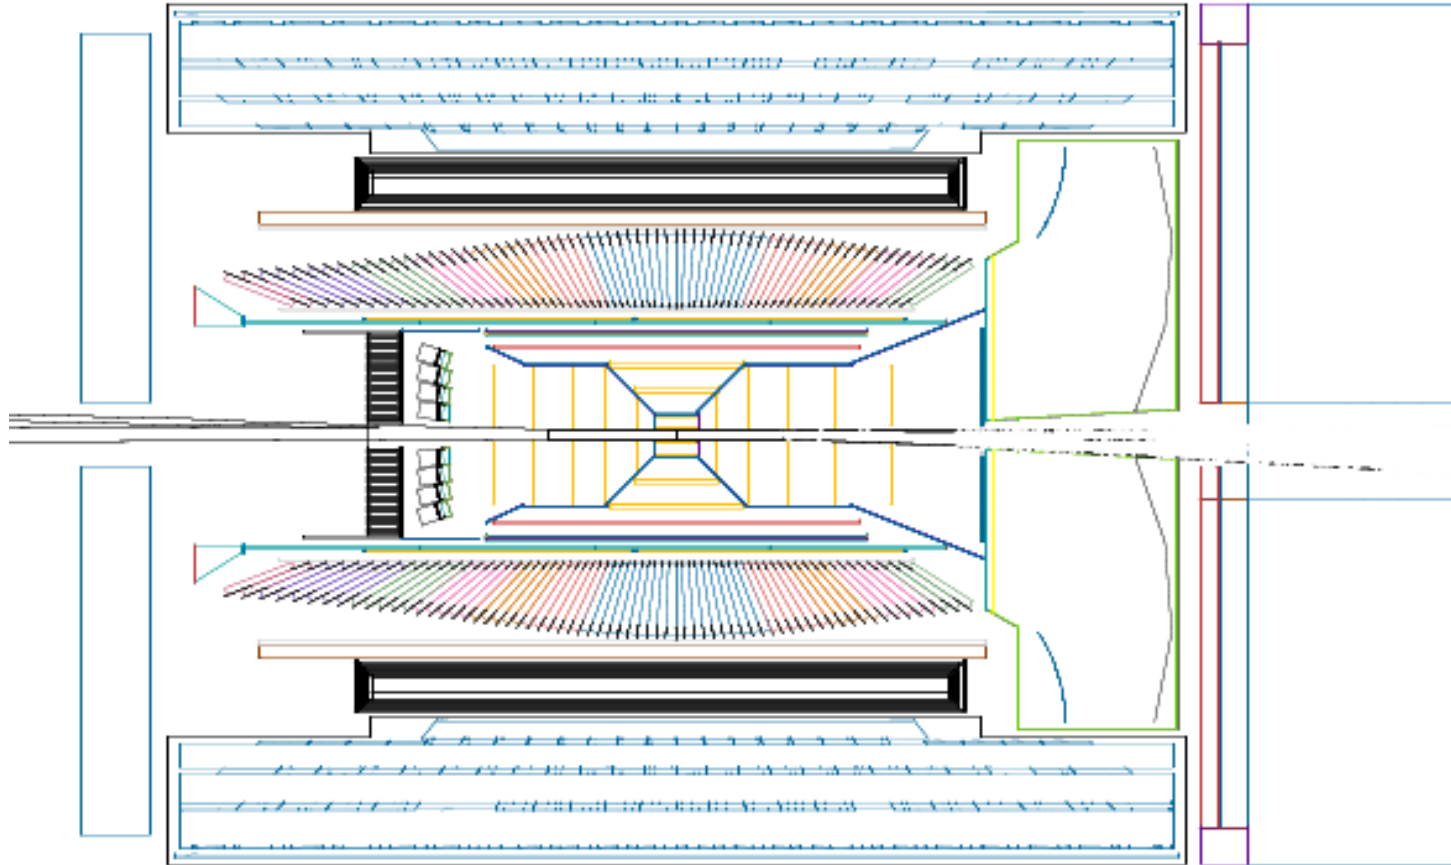

◆ epic-analysis

- Interest from Jets, Heavy Flavor, and Inclusive working groups → more general name

epic-analysis

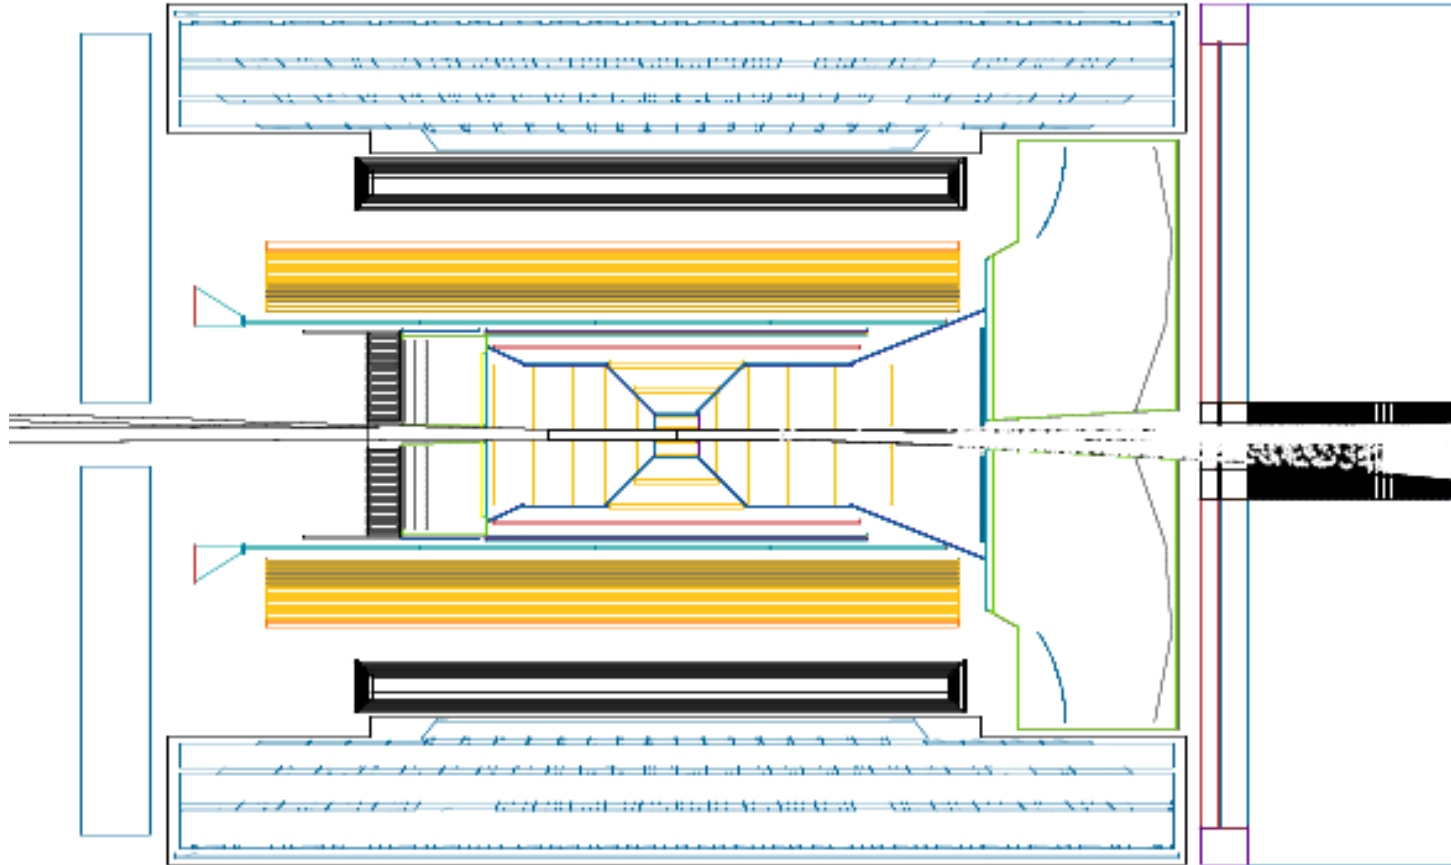

ePIC Detector Configurations

Arches
SciGlass bEcal
mRICH
2nd MPGD behind DIRC

ePIC Detector Configurations

BryceCanyon
Imaging bEcal
pfRICH
Calorimeter Insert

- ◆ Adapts to the varying file tree and naming conventions of past productions
- ◆ Downloads files from S3, or generates lists of URLs for streaming
- ◆ Organizes data by energy and Q2 bin
- ◆ Obtains cross section for Q2 weighting
- ◆ Generates “config files” for usage in epic-analysis
- ◆ Supports ePIC, ATHENA, ECCE, and can run HEPMC files through Delphes

```
epic.22.11.3  :: Pythia 6, with & without radiative corrections
epic.22.11.2  :: Pythia 8
ecce.22.1     :: Last ECCE Production, August 2022
athena.deathvalley-v1.0  :: ATHENA Proposal production
hepmc.pythia6  :: HEPMC files from Pythia 6 for EPIC, with & without radiative corrections
hepmc.pythia8  :: HEPMC files from Pythia 8, used for ATHENA proposal
```

```

Ask us to support other productions, or open a PR

Kinematics Reconstruction Methods

◆ Kinematics calculations performed in dedicated class(es)

- Used for both reconstructed and MC generated particles
- Inputs: beams, scattered electron, hadronic final state, and observed particles (single hadrons for SIDIS, jets, etc.)

◆ Calculations

- Inclusive variables (x , Q^2 , W , y , ...)
 - 6 methods: electron, J.B., double angle, mixed, sigma, eSigma
- SIDIS variables (p , p_T , z , ϕ_h , ...)
- Jet variables (z , p_T , j_\perp , ...)
- In general uses Lorentz invariant calculations; boost to specific frames when needed

◆ Future Plan

- Cross check with upstream calculations from the reconstruction framework and/or upstream our methods

Kinematics Reconstruction with Machine Learning

- Reconstruction with pre-trained tensorflow model available (soon)
- Utilizing full hadronic final state and electron information with Particle Flow networks (<http://energyflow.network>, arXiv:1810.05165) to reconstruct virtual photon four momentum
 - Our application to ATHENA full simulation presented at DIS2022 (arXiv:2209.14489)
- Currently implemented with event-by-event predictions done in python script, bound using pybind11
- Current plan is to store trained model for each COM energy, specified simulation versions in epic-analysis repository
 - Requires tensorflow and energyflow python packages
 - Then callable with “ML” as reconstruction method in epic-analysis
- Validating results on current ePIC simulation, but release soon!

Slide from Connor Pecar

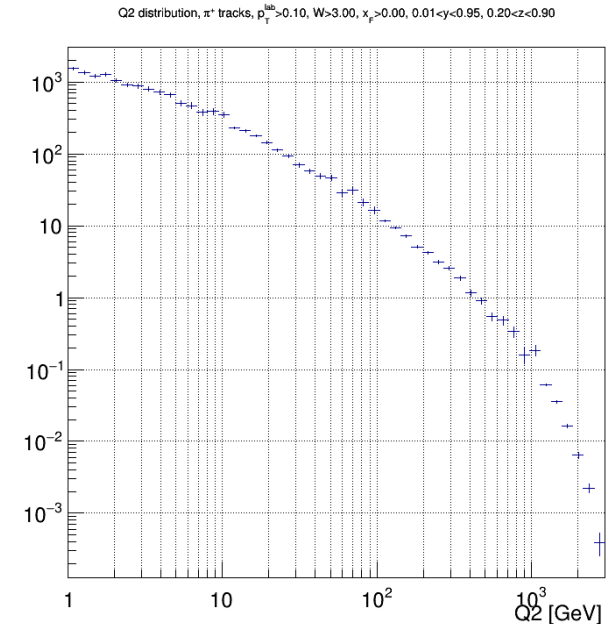

Q² Weighting

◆ Data are produced in varying Q² ranges:

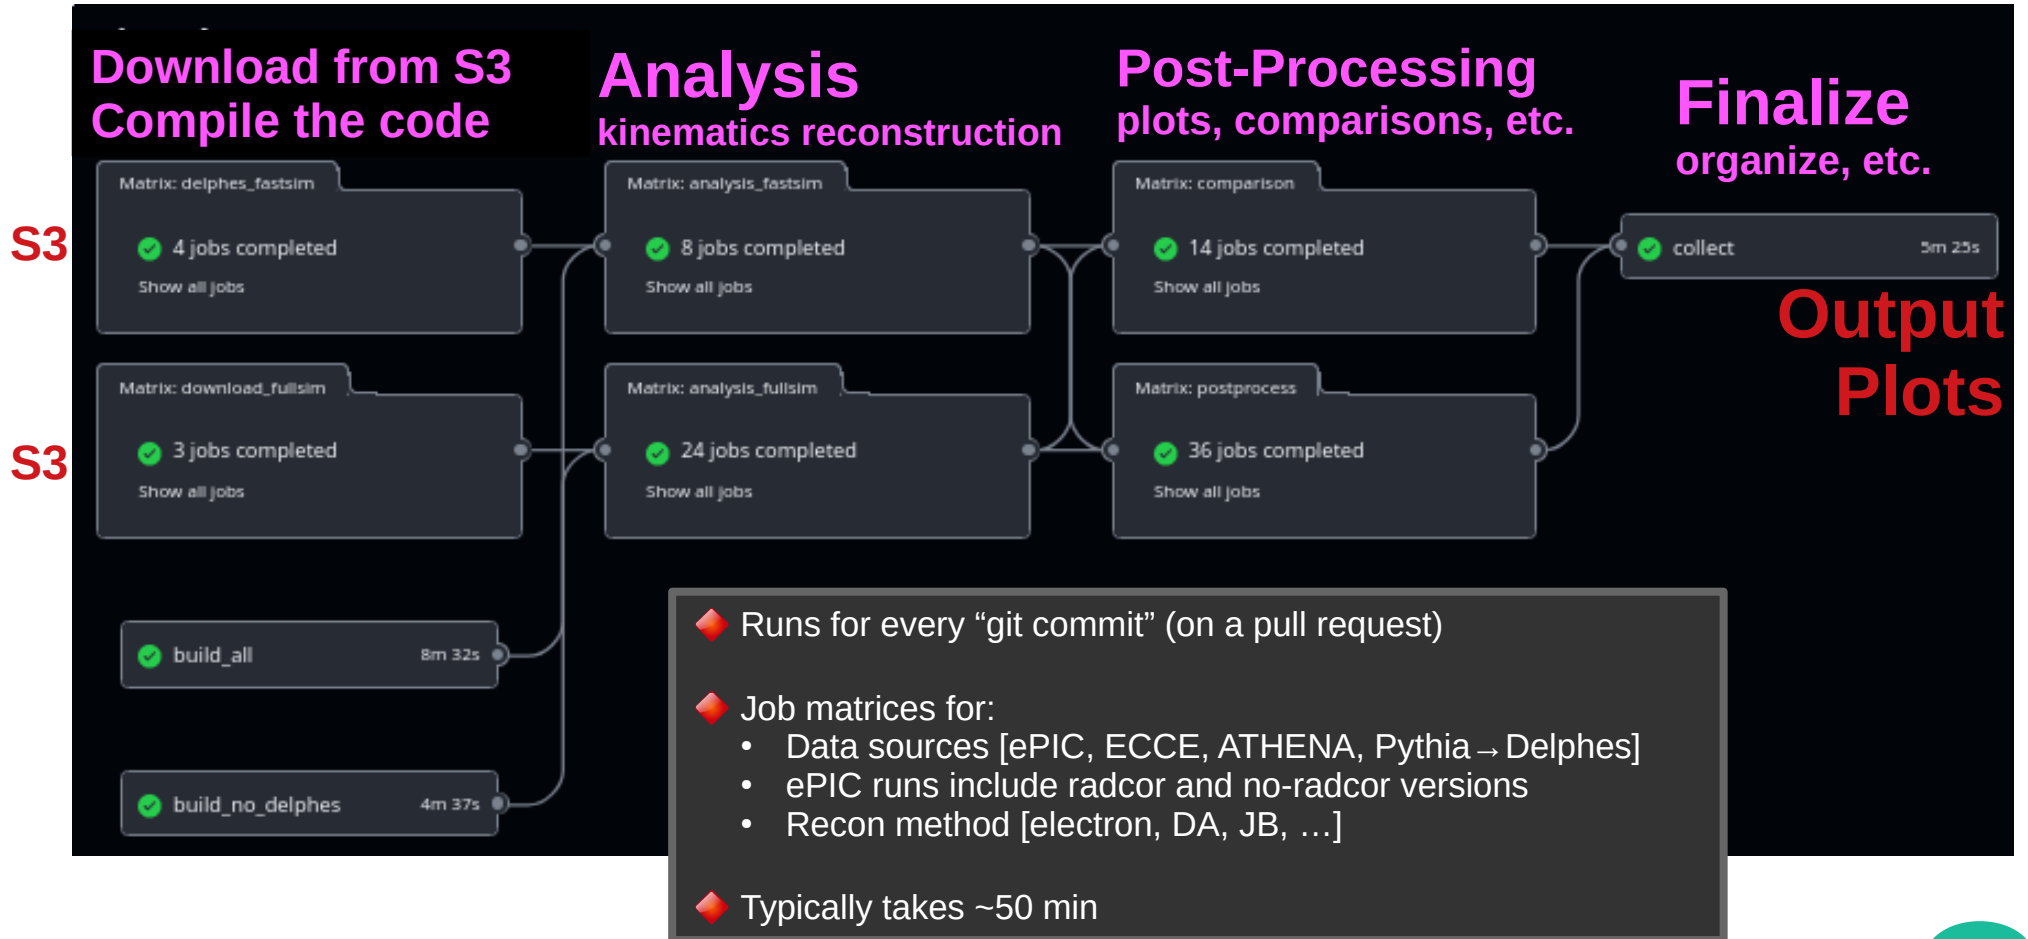

- 1 - 10 GeV²
- 10 - 100 GeV²
- 100 - 1000 GeV²
- 1000 GeV² and above

◆ Use weights to combine them

- Uses Cross sections from Pythia and Number of Events analyzed
- Automated by epic-analysis
 - Maintain a table of cross sections for varying beam energies
- Allows for evaluation in a *broad* Q² range without waiting for rare high-Q² events

Continuous Integration (CI)

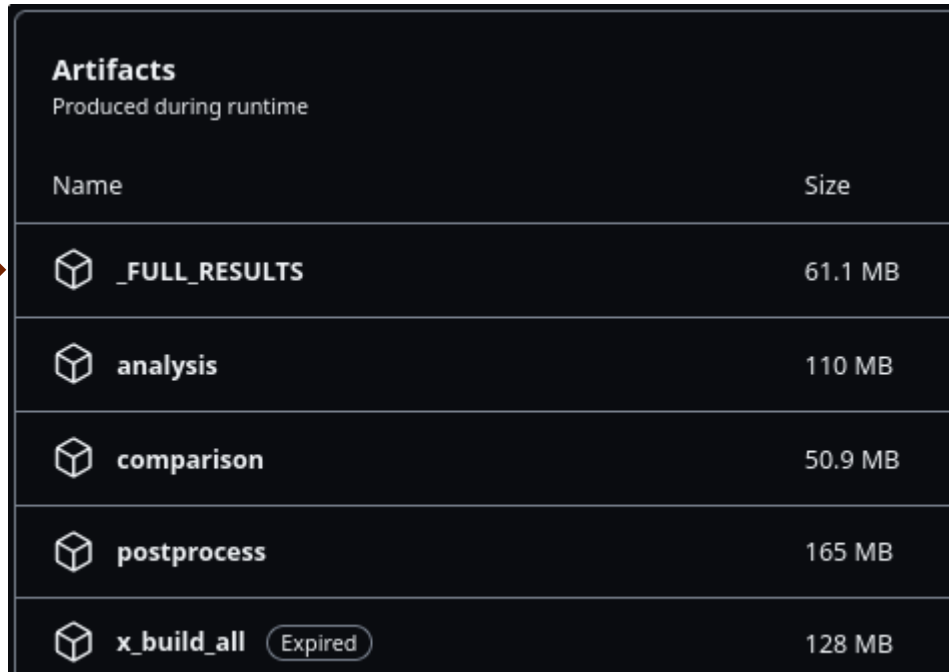

Continuous Integration (CI)

- ◆ Artifacts = CI output plots (and more)
- ◆ Final set of plots in ‘_FULL_RESULTS’
- ◆ Must be logged into GitHub to access

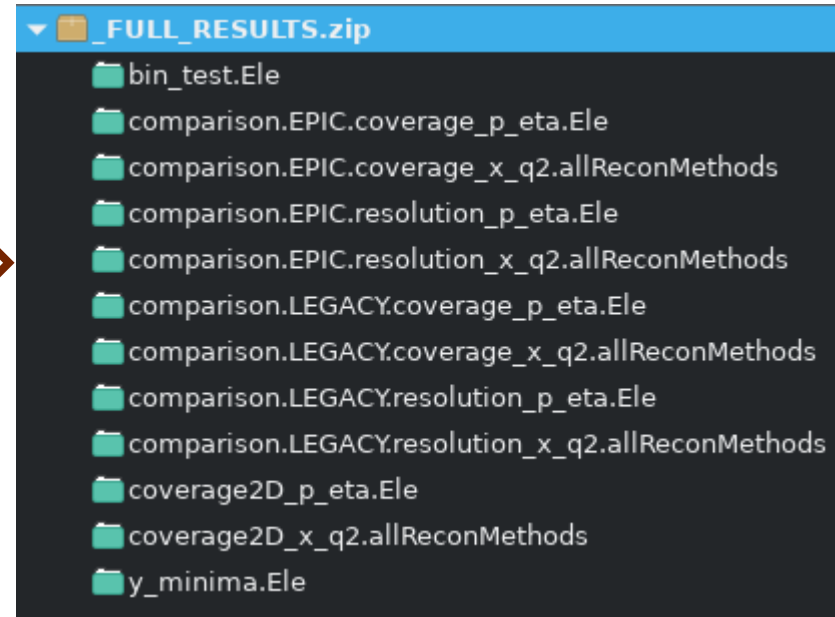

Example artifacts (high statistics):

<https://github.com/eic/epic-analysis/actions/runs/3853010345>

The screenshot shows the 'Artifacts' section of a GitHub Actions workflow. It lists several artifacts produced during runtime, including '_FULL_RESULTS', 'analysis', 'comparison', 'postprocess', and 'x_build_all'. The '_FULL_RESULTS' artifact is highlighted with a large orange arrow pointing to the right.

Name	Size
 _FULL_RESULTS	61.1 MB
 analysis	110 MB
 comparison	50.9 MB
 postprocess	165 MB
 x_build_all Expired	128 MB

Productions used for CI

◆ ePIC 22.11.3

- S3/eictest/EPIC/RECO/22.11.3/epic_{arches,brycecanyon}/SIDIS/pythia6
- With and without radiative corrections

◆ ECCE 22.1

- S3/eictest/EPIC/Campaigns/22.1/SIDIS/pythia6

◆ ATHENA DeathValley 1.0

- S3/eictest/ATHENA/RECO/deathvalley-v1.0/DIS/NC

◆ Delphes – Fast Simulations

- HEPMC files from S3/eictest/EPIC/EVGEN/SIDIS/pythia6
- Run through Delphes (CI job)
- Using the sample with radiative corrections
- **Uses legacy ATHENA settings – needs to be updated!!**

Event Selection for CI

$$W > 3 \text{ GeV}$$

$$0.01 < y < 0.95$$

$$0.2 < z < 0.9$$

$$x_F > 0$$

$$p_T(\text{lab}) > 0.1 \text{ GeV}$$

Focusing on 18x275 (for now)

- ◆ Testing all available reconstruction methods
- ◆ Histograms in bins of
 - (x, Q^2)
 - (η, p)

In the interest of time, for these slides:

- Distributions and resolutions of: x, p_T, z, ϕ_h
- Also focusing on the Electron reconstruction method

Comparison Plots from CI

ePIC vs. ePIC

	Arches	Bryce Canyon
With radiative corrections	•	•
Without radiative corrections	•	•

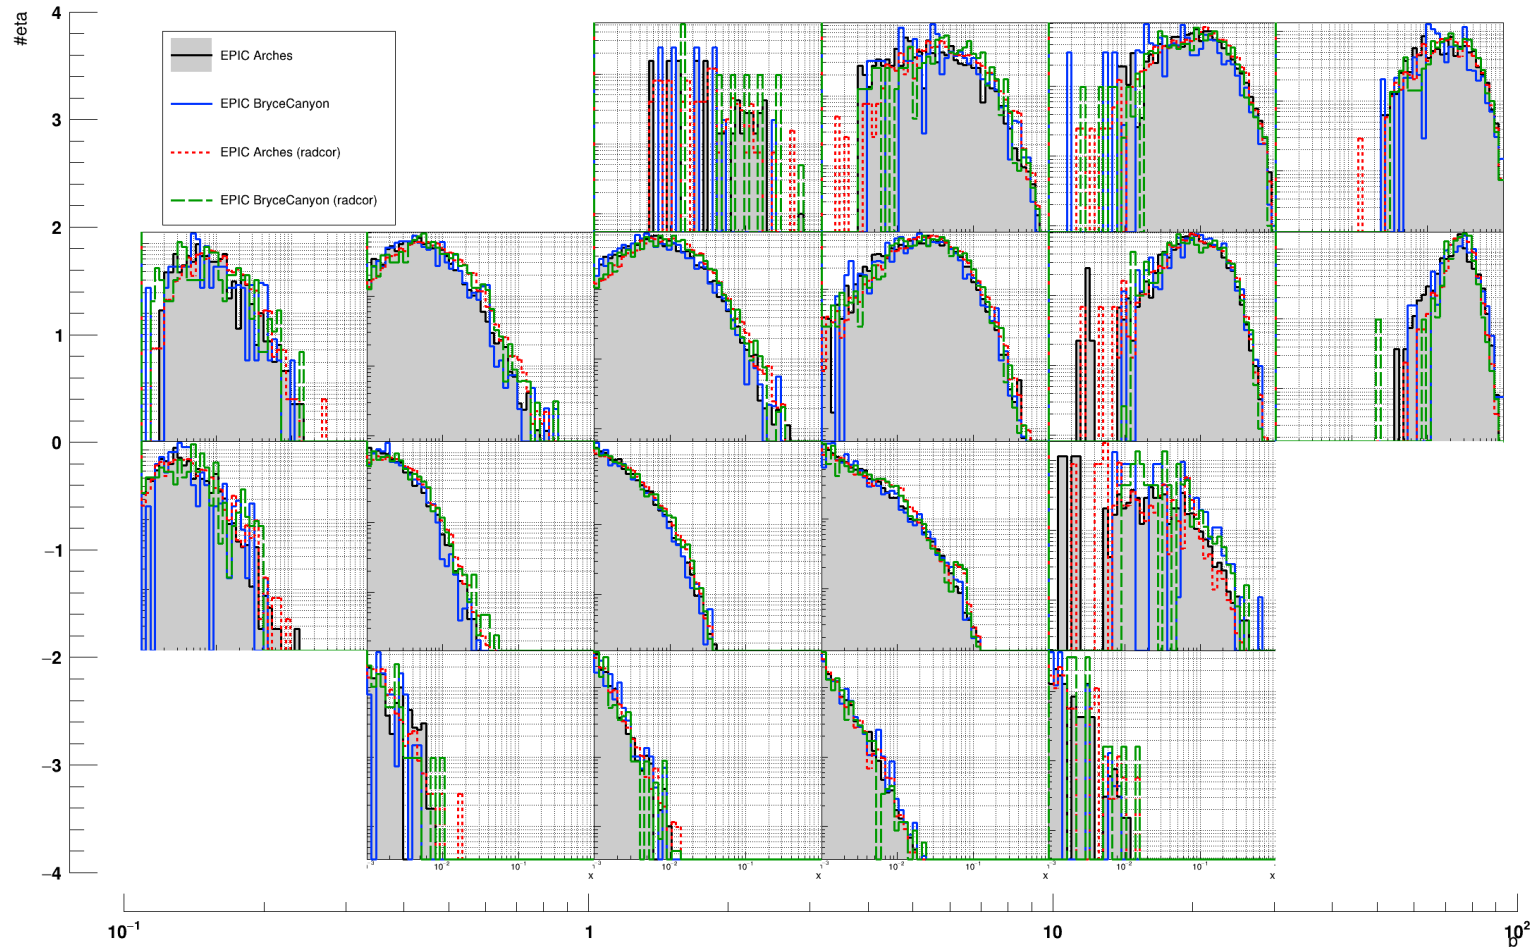

ePIC vs. Legacy

	ePIC Arches, with radiative corrections
Delphes (ATHENA card)	•
ATHENA	•
ECCE	•

CI allows us to make regular comparisons of ePIC configurations, effects from radiative corrections, and ePIC with legacy designs (ATHENA and ECCE)

Future Support: Dihadrons

- ◆ Work in Progress: <https://github.com/eic/sidis-eic/pull/192>
 - Kinematics – done, but needs validation / cross check
 - Inclusive Pairing – done, but needs validation

Future Support: Jets

- ◆ Already supported in Delphes analysis chain, using fastjet anti- k_T

$$\eta > 1$$

Summary

◆ epic-analysis

- Supports ePIC full simulation, Delphes fast simulation, and legacy ECCE and ATHENA productions
- Automates retrieval of data from S3 and Q² weighting
- Kinematics Reconstruction via various methods

◆ Continuous Integration

- As a “slow” benchmark
- Comparisons of ePIC vs. ePIC and ePIC vs. Legacy

◆ Short term plans

- Dihadrons
- Jets
- Scaling (support higher statistics)

backup

Handling Multidimensional Binning

- ◆ Problem: The need for multidimensional analysis caused deeply nested for loops to spread throughout epic-analysis
 - Not maintainable and not generalized
 - Very susceptible to bugs

```
for (auto z_bin : z_bins) {
  for (auto y_bin : y_bins) {

    action_before_x_Q2_subloop( z_bin, y_bin );

    for (auto Q2_bin : Q2_bins) {
      for (auto x_bin : x_bins) {

        action_for_each_bin( z_bin, y_bin, Q2_bin, x_bin );

      }
    }

    action_after_x_Q2_subloop( z_bin, y_bin );

  }
}
```

◆ Solution: use a Directed Acyclic Graph (DAG)

- Fully connected layers of 1D bins
- One path from root node to leaf node == 1 multidimensional bin
- “Control nodes” store lambdas, executable during depth-first traversal

```
// define lambdas
```

```
action_before_x_Q2_subloop = ... ;
```

```
action_after_x_Q2_subloop = ... ;
```

```
action_for_each_bin = ... ;
```

```
// attach lambdas to the DAG
```

```
P->Op()->BeforeSubloop( {"x","q2"}, action_before_x_Q2_subloop );
```

```
P->Op()->AfterSubloop( {"x","q2"}, action_after_x_Q2_subloop );
```

```
P->Op()->Payload( action_for_each_bin );
```

```
// run
```

```
P->Execute();
```

4D Binning in (z,y,Q^2,x)

Upstream
