Search for new physics: Diboson resonance searches in ATLAS Run-2

Reina Camacho Toro
University of Chicago

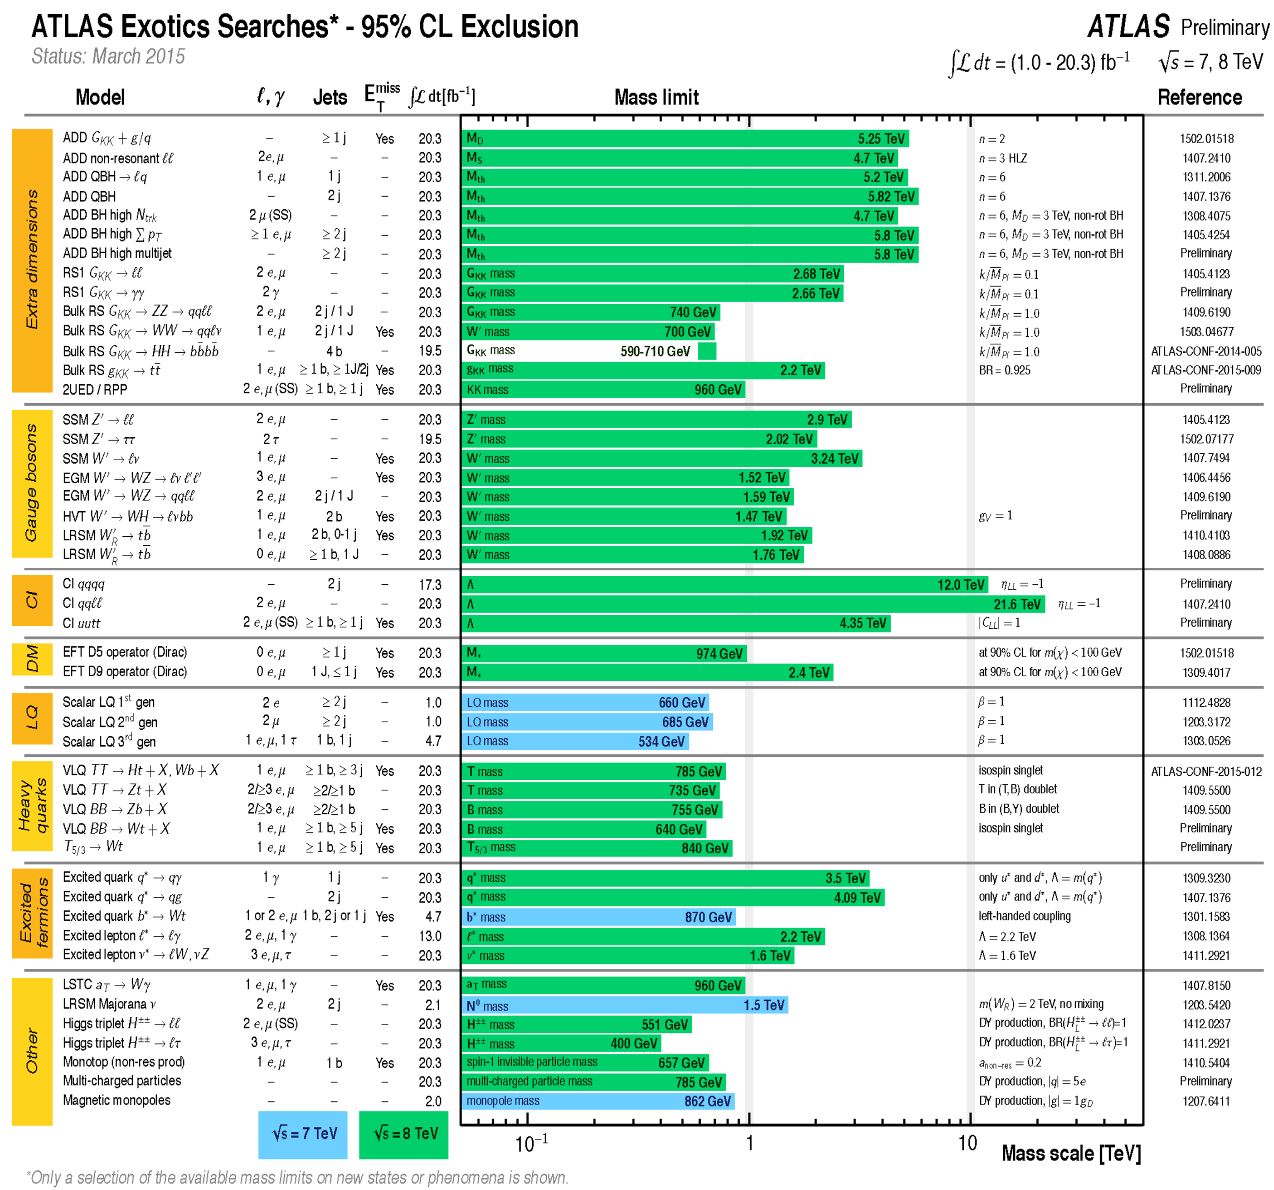
BNL Seminar
May 19th, 2016

Outline

- Motivation
- Reconstruction techniques for high mass resonances
- Recent Run-2 searches results
  - VV resonances
  - VH resonances
  - Vγ resonances
- Conclusions

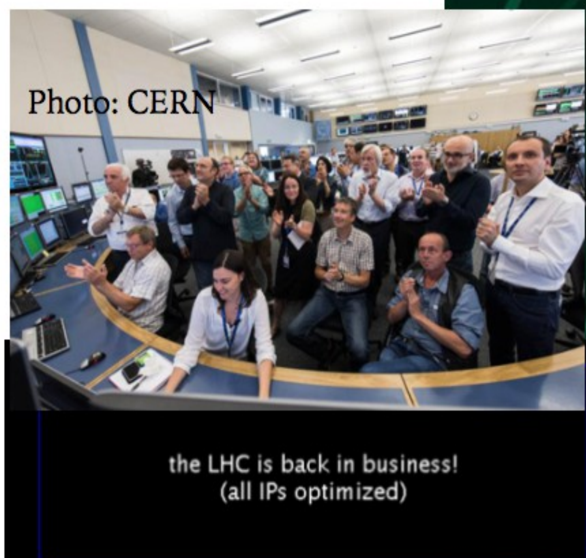
Lessons from Run-1

- Detectors performed very well in challenging LHC environment
- A Higgs boson was discovered with less luminosity and half the energy
- Remeasuring the Standard Model (SM)
- Nothing beyond the SM yet (not significant ones at least)

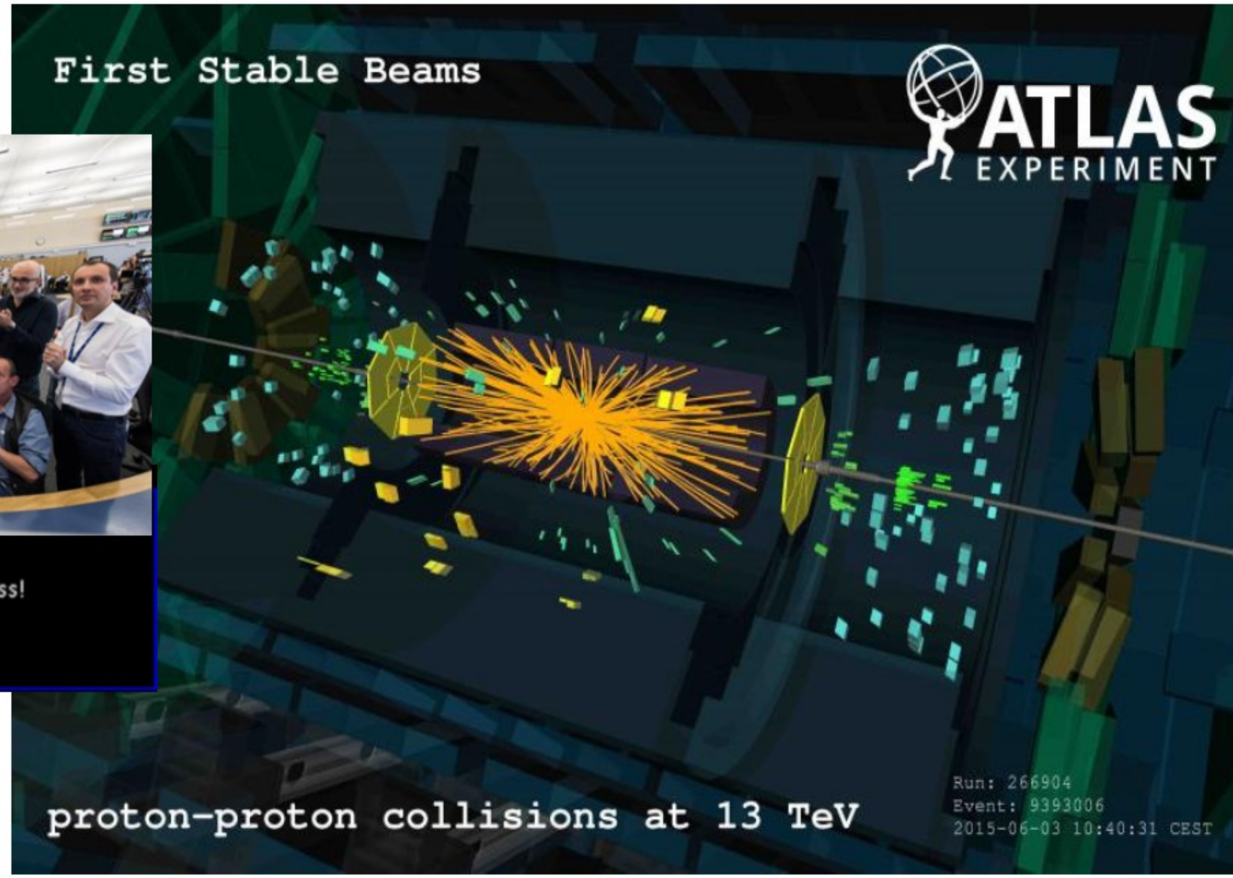


LHC Run-2 started last year

LHC proton-proton collisions restarted in June 2015 at **13 TeV**



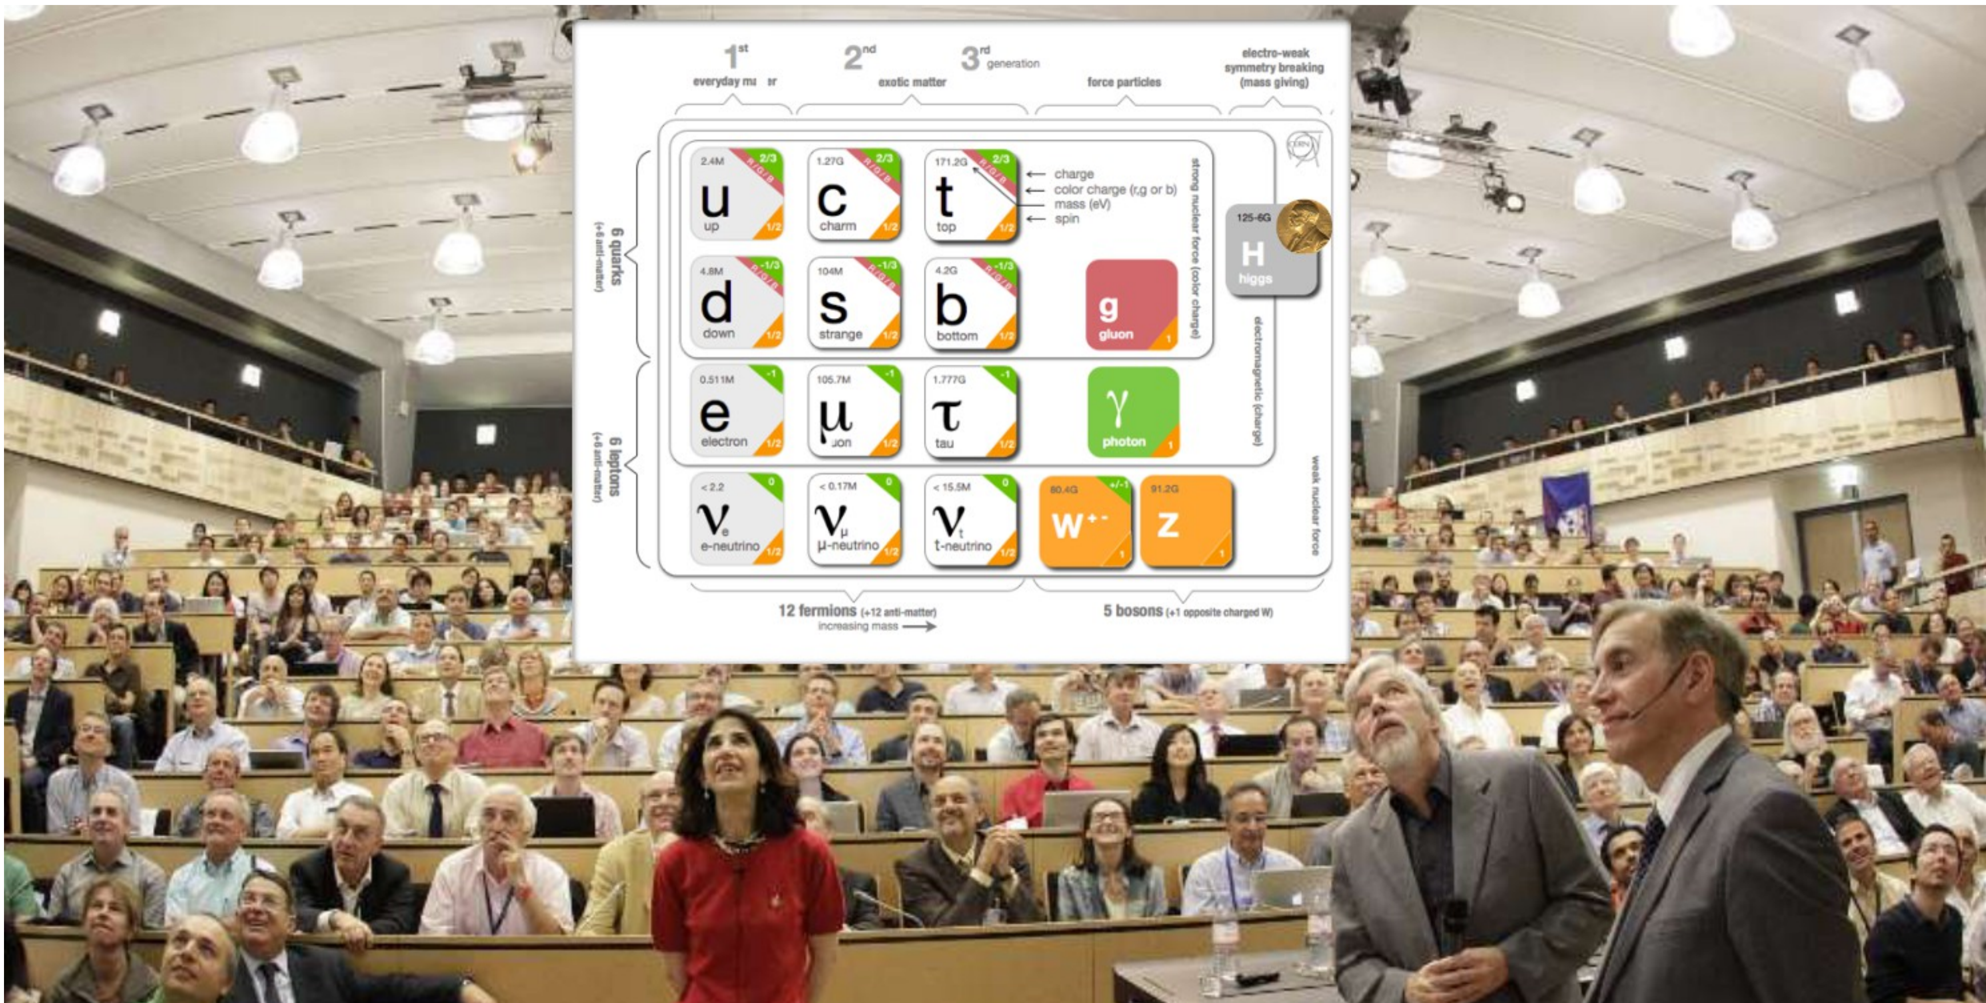
Thanks to the LHC team!



- ATLAS program for Run-2?
  - Is this boson the Higgs boson?
  - Increase precision in SM measurements
  - **Push searches BSM further**

Discovery of the Higgs boson

Guided by ***clues*** from the SM of particle physics



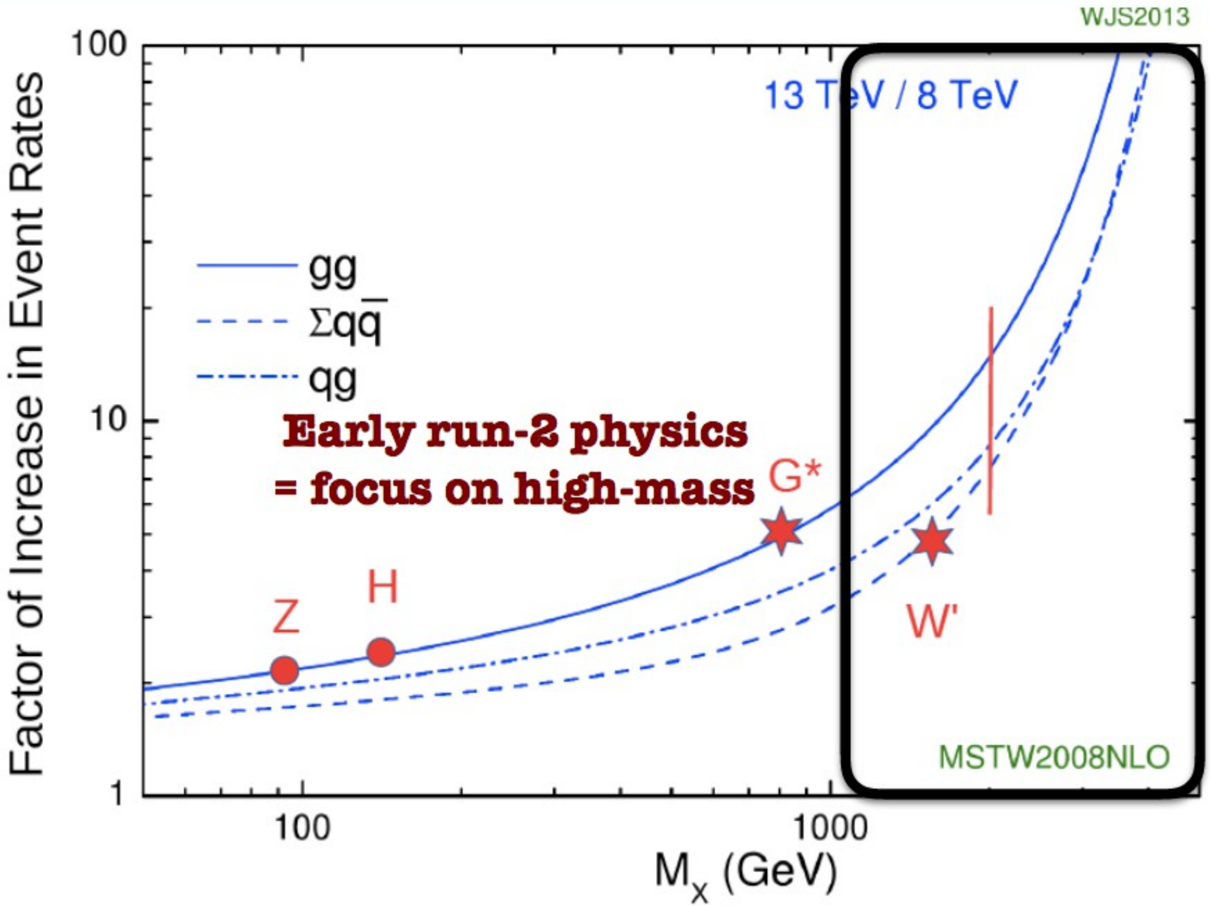
Where to look for new physics in Run-2?

- Everywhere starting with high masses

- Increase of energy → Increase of reach for new phenomena

- Example: production rate of a W' with a mass of 2 TeV increased by 5x times from Run-1 to Run-2
  - You already can see where this is going...

- High mass searches are challenging!
  - Usually require revisiting our object reconstruction and analysis techniques



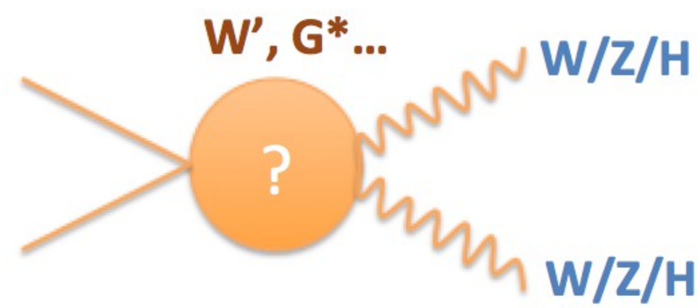
High mass diboson searches are well motivated

- Interactions with pairs of electro-weak bosons are a **fundamental element in electroweak symmetry breaking**

- These interaction played a key role in the **Higgs boson discovery in Run-1**

- The high mass is **particularly sensitive** to a wide range of **BSM physics models**

- **Diboson searches important in general**

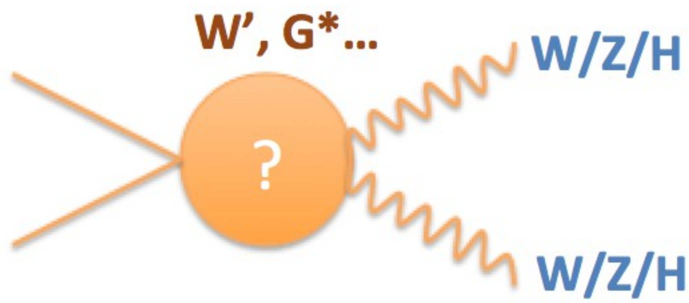


- ✔ Clear signature in detector
- ✔ Known properties and decay kinematics

High mass diboson searches are well motivated

- **Several theories predict the existence of new heavy resonance coupling to W/Z/Higgs**
  - Extra dimensions, compositness, GUT

- Resonance benchmarks you will hear about in this talk
  - Spin 0 **Higgs-like scalar** singlet
  - Spin-1 **HVT** (simplified Lagrangian)
    - *Model A:* Stronger constraints from leptonic searches
    - *Model B:* Enhanced couplings to dibosons
  - Spin-2 **Randram Sundrum graviton (RGS)**

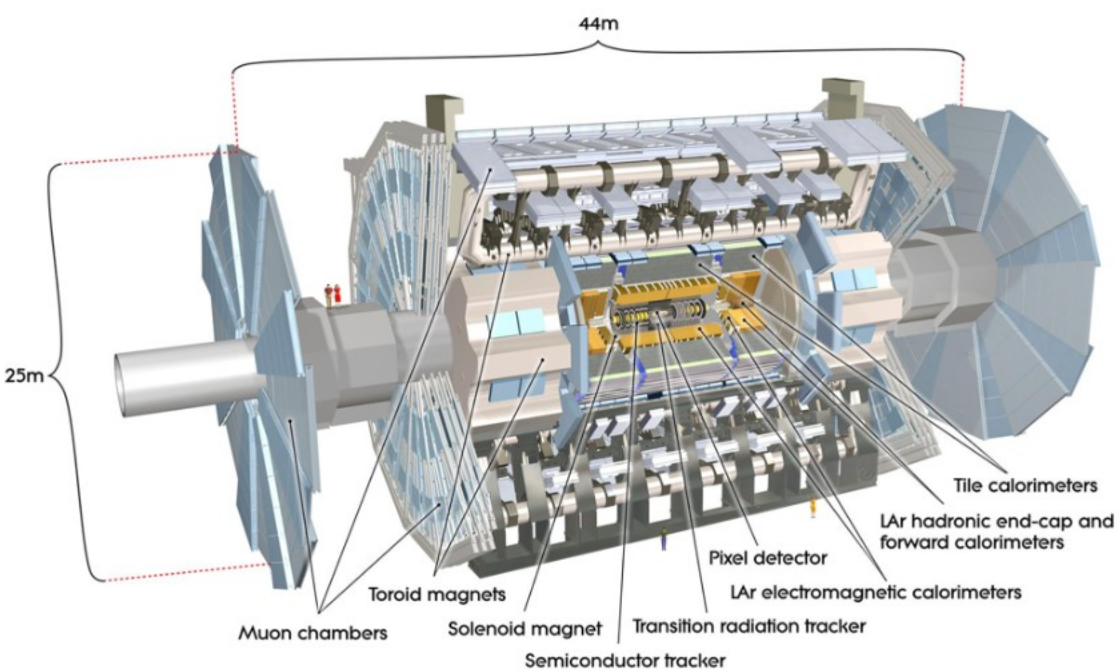


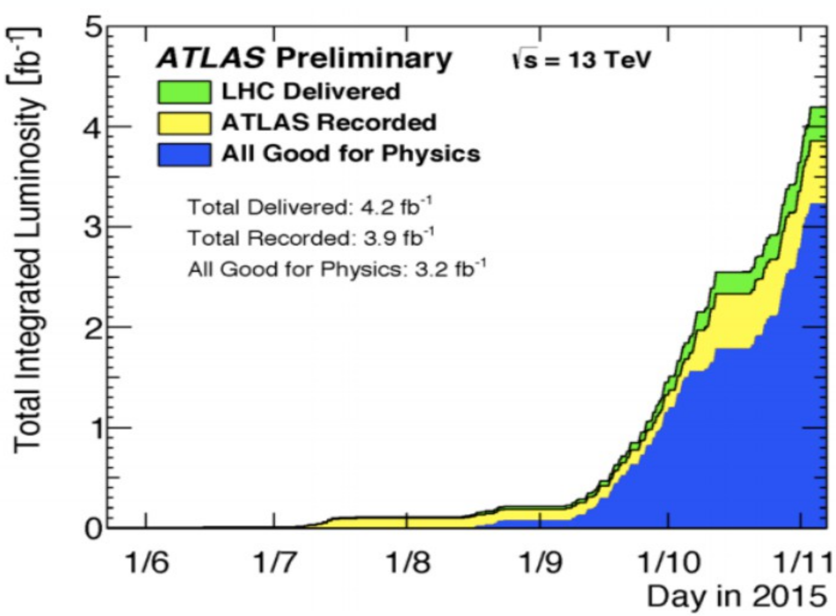
- ✓ Clear signature in detector
- ✓ Known properties and decay kinematics

	WW	WZ	ZZ
HVT	Z'	W'	
Gravi	RSG		RSG
Scalar	Scalar		Scalar

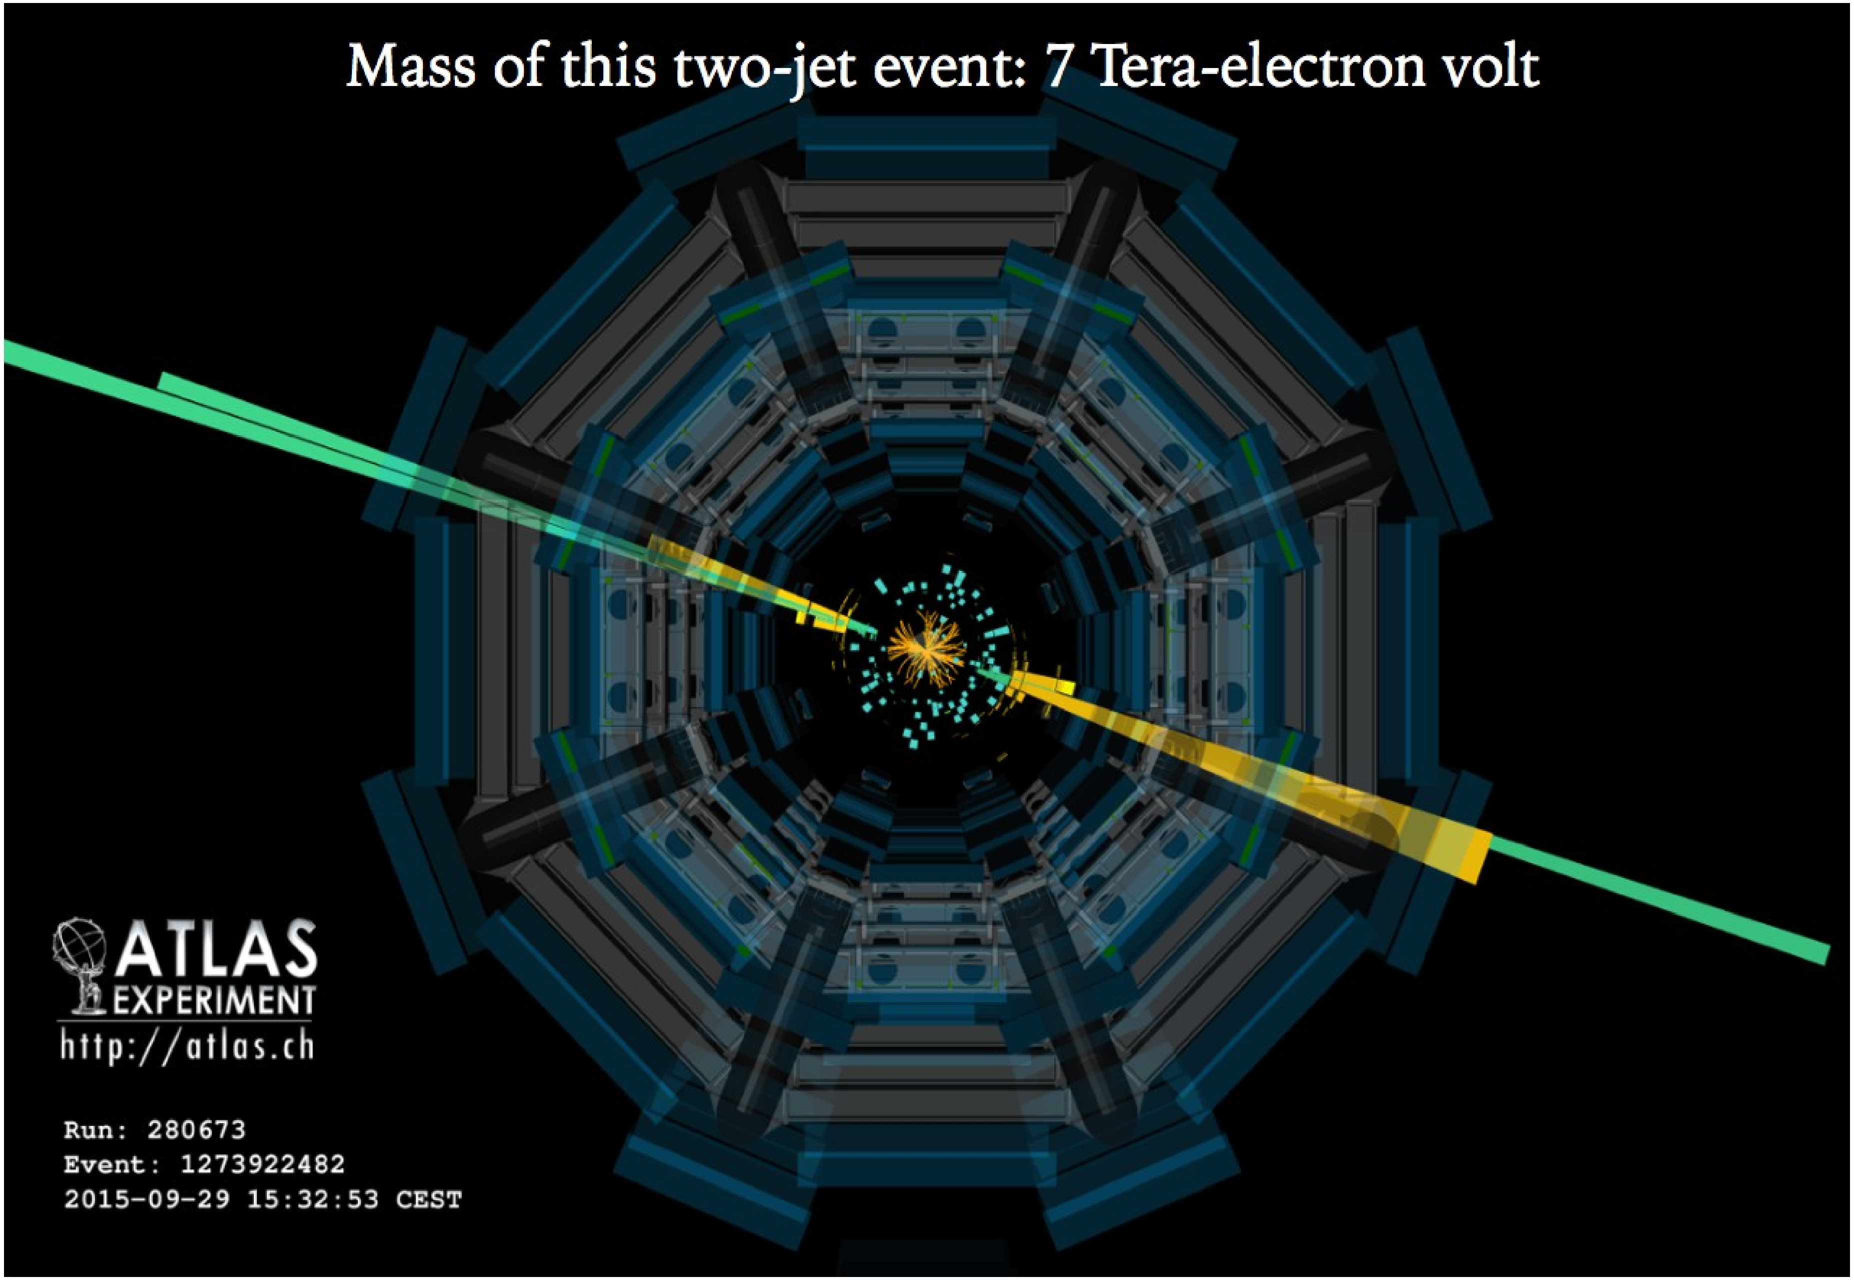
LHC Run-2 started last year

- **3.2/fb of 25 ns data good for physics**
- Data quality efficiency **87%-93%**
- Smooth running and excellent trigger performance!
  - >96% working channels (pixels, cells, …) in each sub-detector

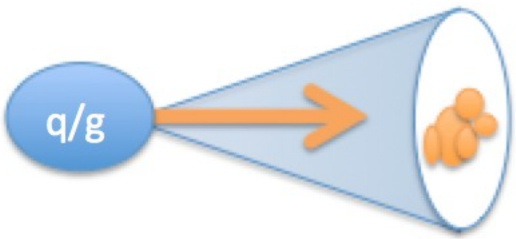




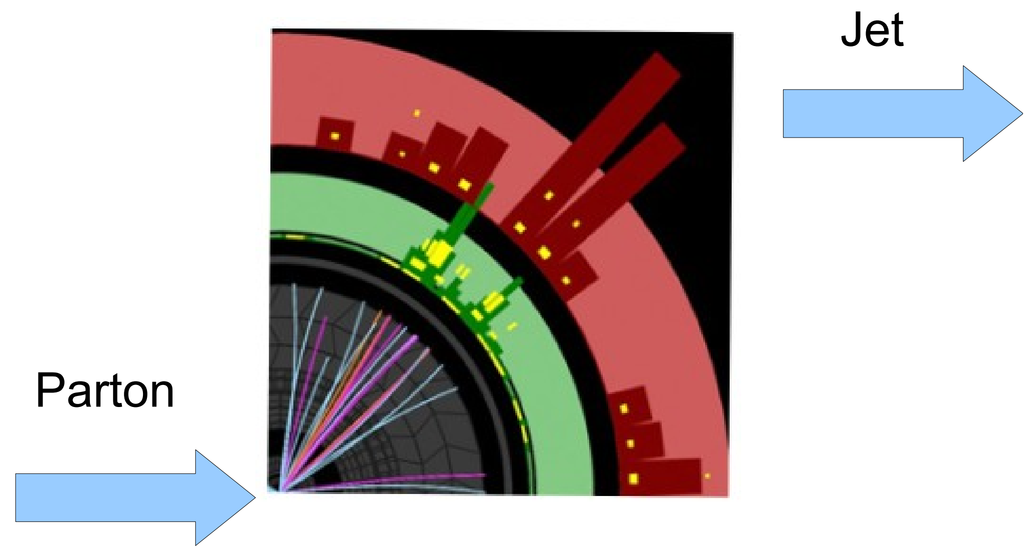
Reconstructing high mass bosons
Traditional jet algorithms



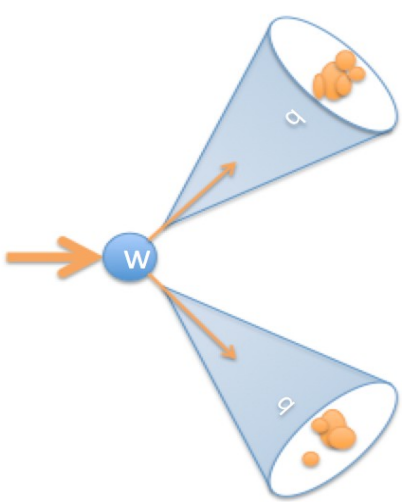
Reconstructing high mass bosons
Traditional jet algorithms

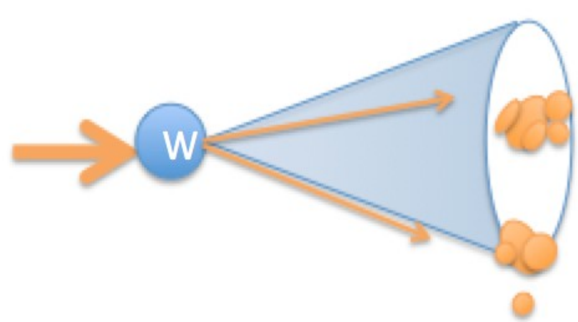


Radius of the jet is chosen to capture the radiation pattern of the a parton
→ ATLAS default R~0.4

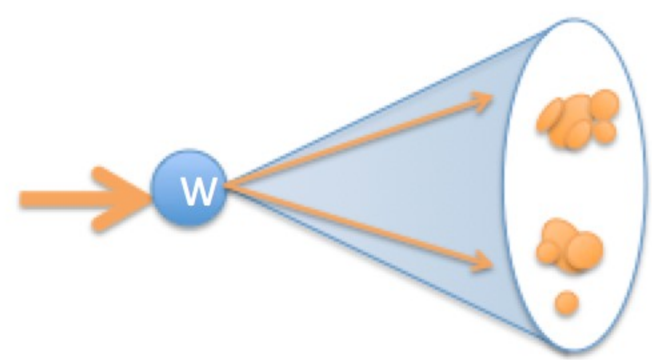


Resolved regime	Merged regime



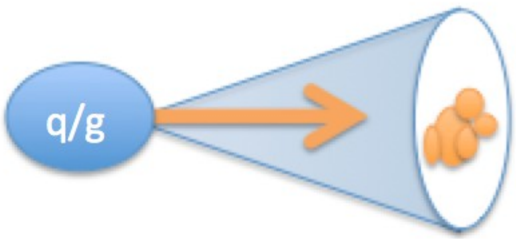


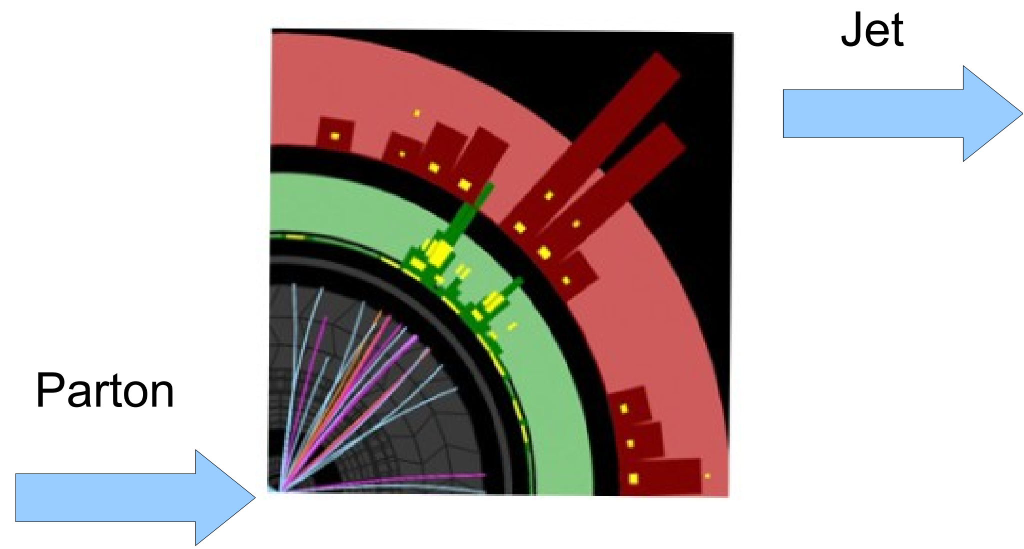
Standard algorithms
ATLAS default R~0.4



“New” algorithms
Large-R jets

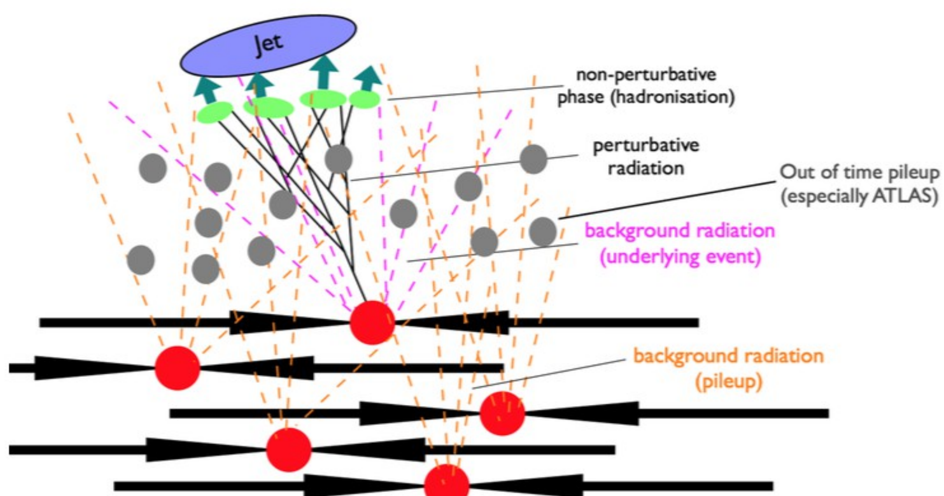
Reconstructing high mass bosons
Traditional jet algorithms



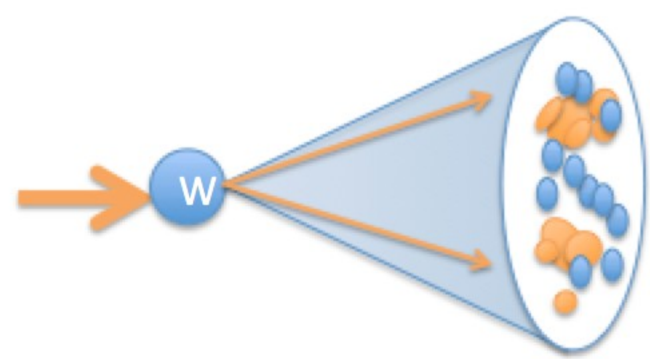


Radius of the jet is chosen to capture the radiation pattern of the a parton
→ ATLAS default R~0.4

In the presence of pile-up (PU) … Not so easy anymore



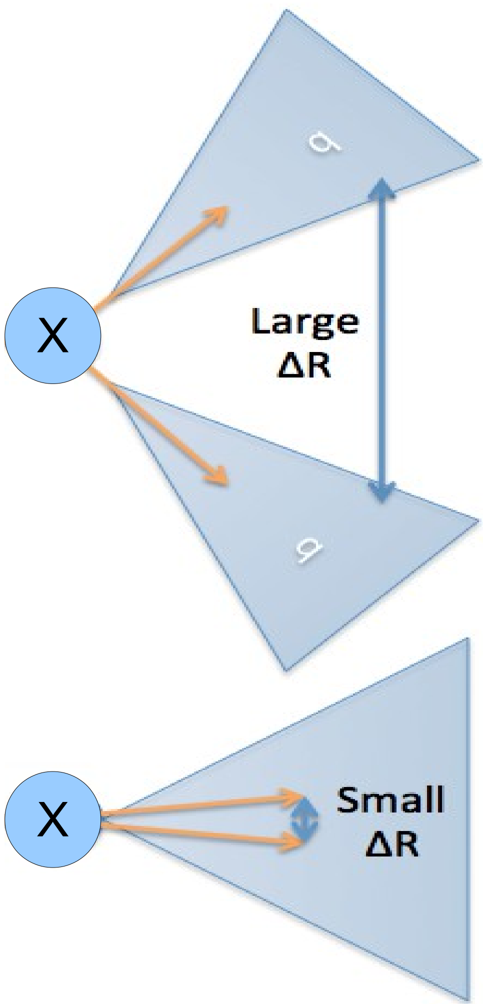
Merged regime



"New" algorithms
Large-R jets

Reconstructing high mass bosons

(X=W, Z, H, top, other new particle?)

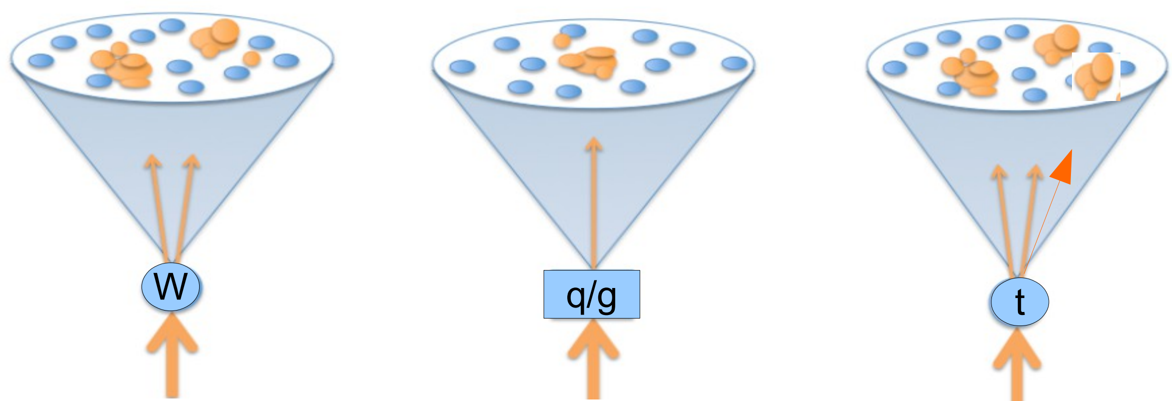


- **Resolved regime:** X has relative low momentum in the lab frame so we are able to reconstruct one jet for one quark
- **Merged regime:** X has high momentum in the lab frame, decays is collimated, outgoing quarks can be reconstructed in the same jet
- Rule of thumb for angular separation of decay products

$$\Delta R = \sqrt{\Delta\phi^2 + \Delta\eta^2} \approx \frac{2m}{p_T}$$

A W boson with p_T~200 GeV, ΔR=0.8

- Differences in the mass and in the internal distribution of the energy inside QCD and bosonic/top jets can help us distinguishing between both



Cartoons by A. Martyniuk

BooBo/top tagging: what do we need?

Fat jets

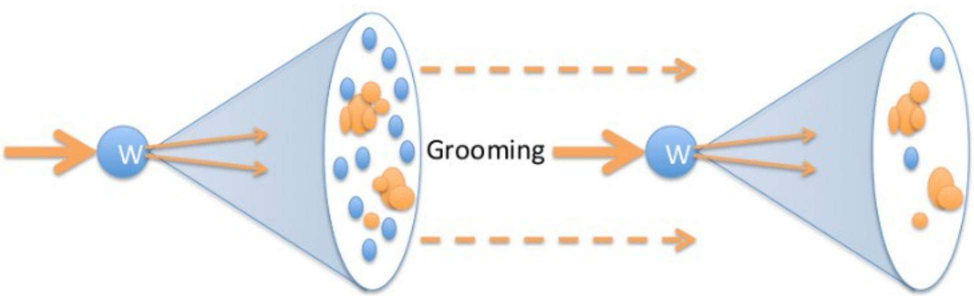
• Large distance parameter to pick up all radiation from original decay

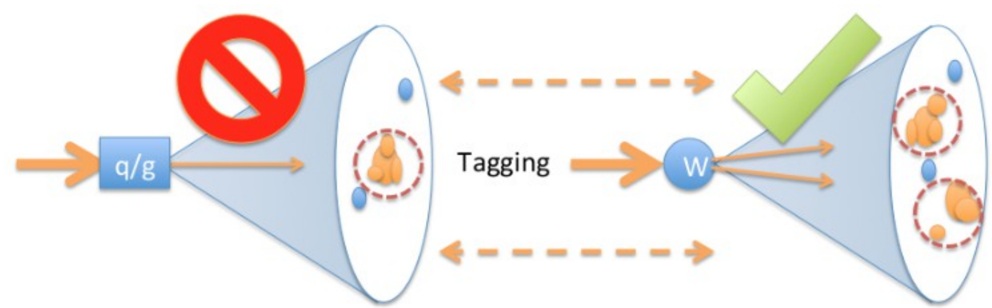
Grooming

• Remove soft comp. PU+UE
• Increase separation between signal and background
• Improve resolution of the signal mass peak

Tagger: substructure

• Observables to characterize the underlying jet substructure, i.e. jet mass, momentum balance between subjets, track multiplicity



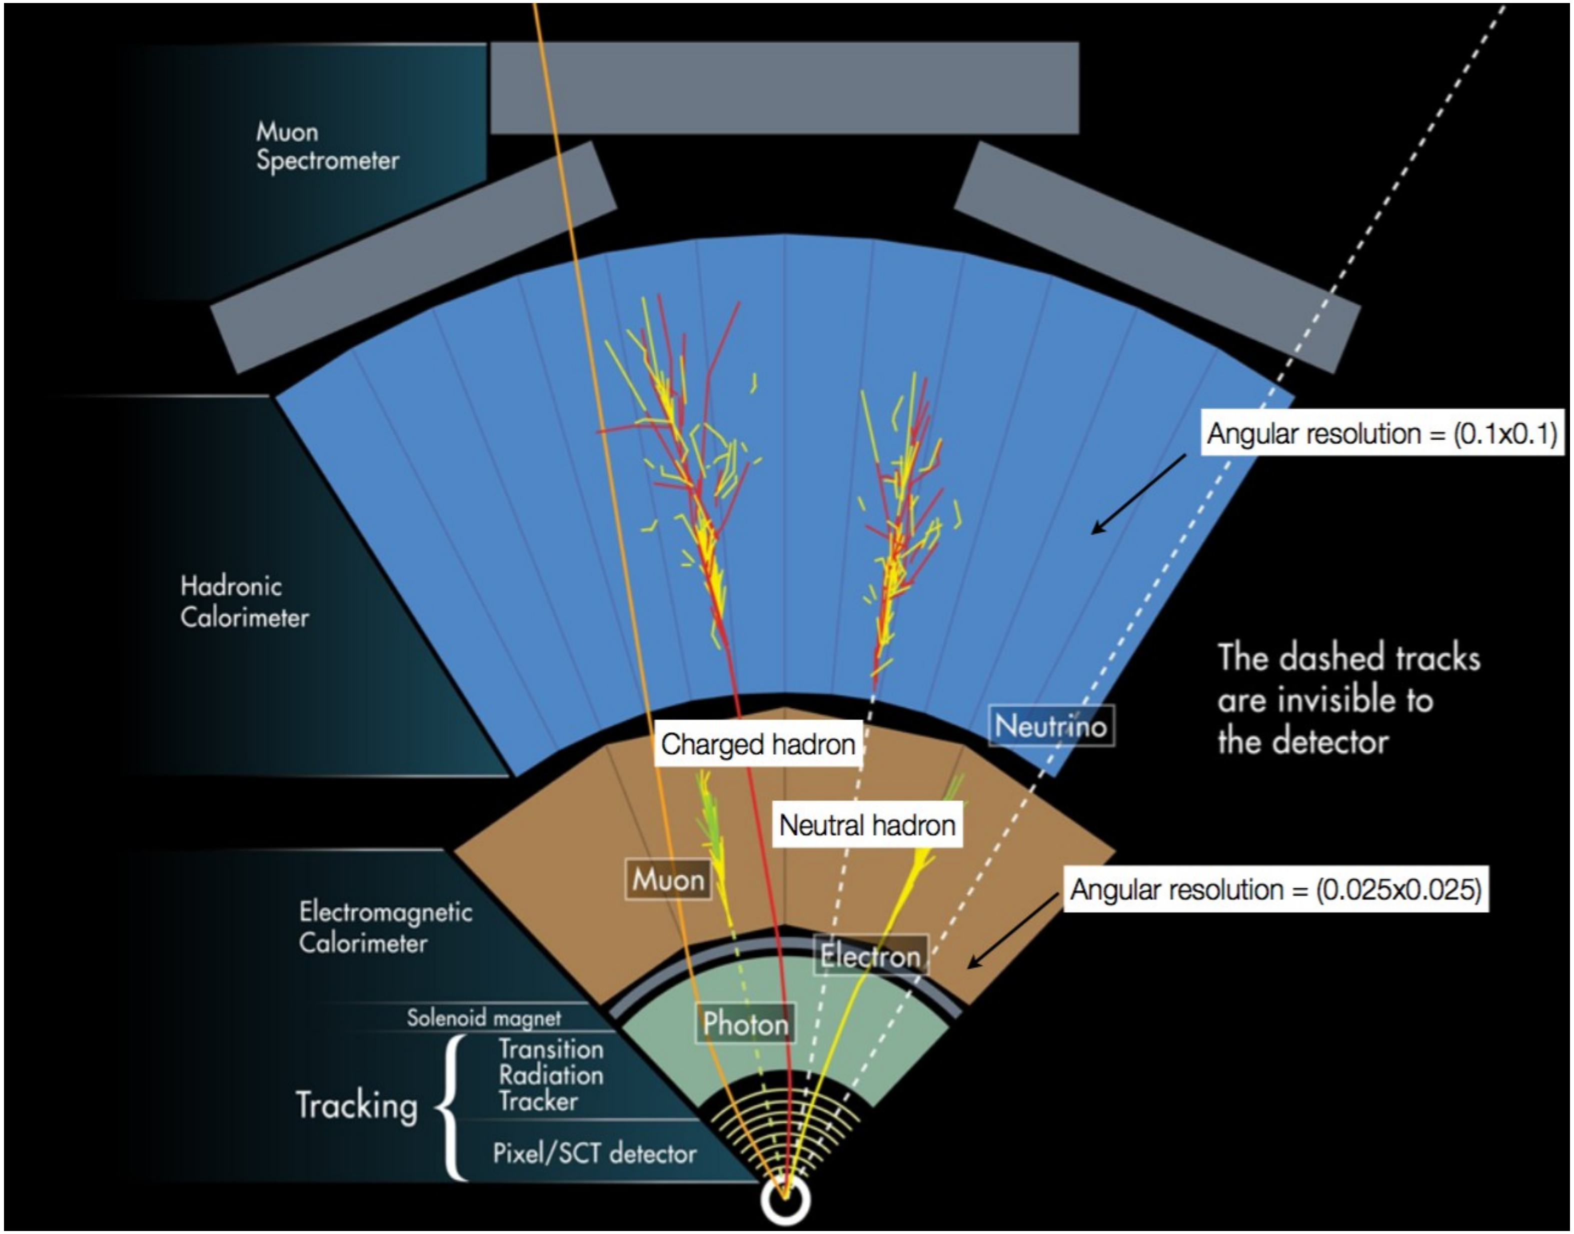


B-tagging

• $H \rightarrow bb$, $Z \rightarrow bb$
• For obvious reasons
• Standard algorithms not adapted for dense environments

Cartoons by A. Martyniuk

ATLAS calorimetry

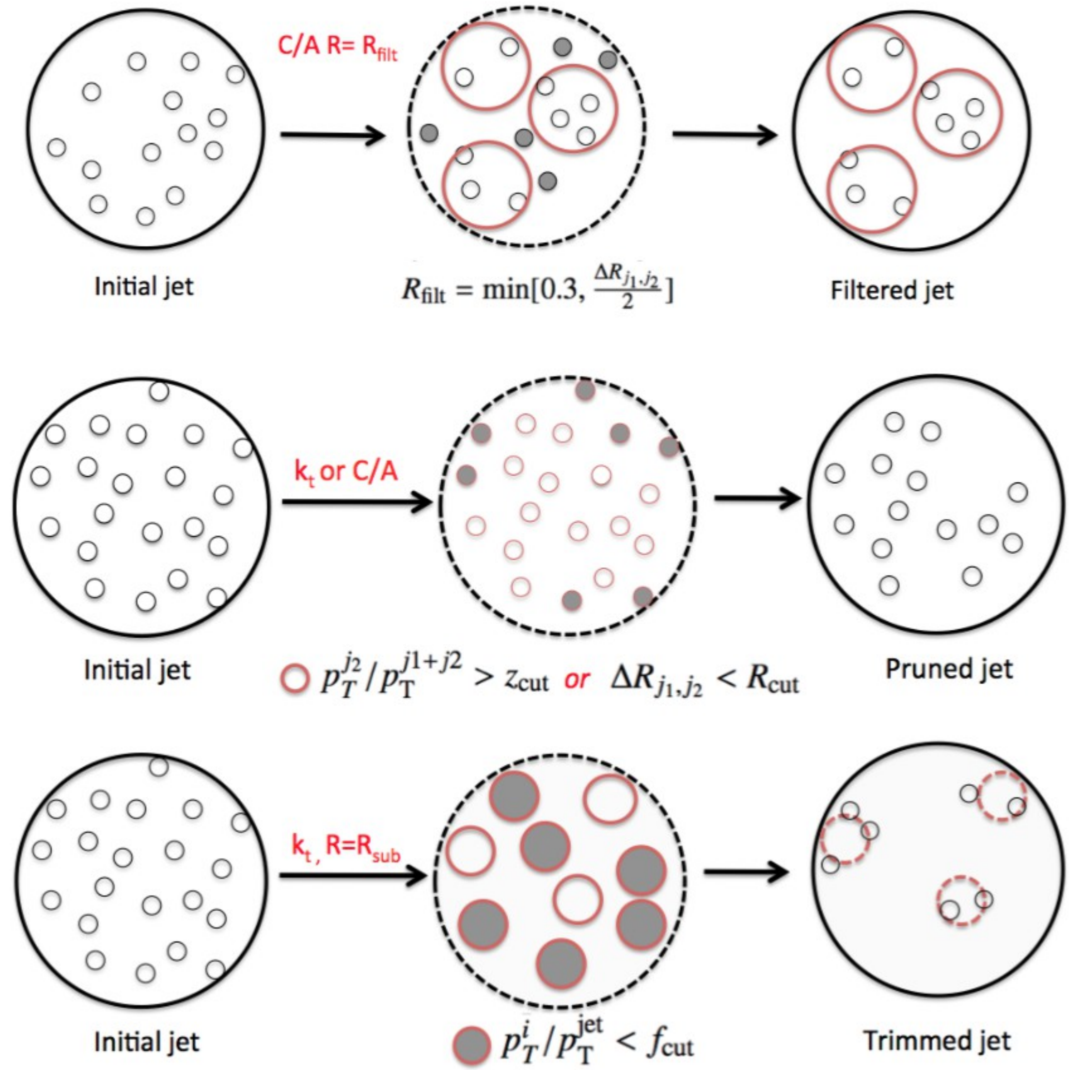


Good resolution to pick apart the large-R jets and look at its substructure

Grooming techniques

Can not cover all tools…but these 3 are widely used

- **Split-filtering:** http://arxiv.org/abs/0802.2470
  - Decluster and discard soft junk
  - Requiring symmetric splitting
  - Repeat until find hard structure
  - Small-radius jet reclustering, keeping only the three highest p_T subjets
- **Pruning:** http://arxiv.org/abs/0912.0033
  - Constituents of large-R jet are reclustered with either C/A or k_t algorithm
  - In each clustering step, large angle and soft clusterings are removed
- **Trimming**: http://arxiv.org/abs/0912.1342
  - Reclustering of constituents of large-R jet into small-R jets of size R_{sub}
  - Remove subjet *i* if $p_T^i < f_{cut} \times p_T^{jet}$
  - **Default ATLAs groomer (stable against PU)**



arXiv:1306.4945

Jet variables for tagging

Again...can not cover all! Some of them strongly linear correlated

Mass

- Deduced from 4-momentum sum of all jet constituents
- Expected to be small for QCD jets, but closer to the boson/top mass for signal jets

N-subjettiness (*JHEP 03 (2011) 015*)

- Measure of how N or less "subjet"-like a large-R is

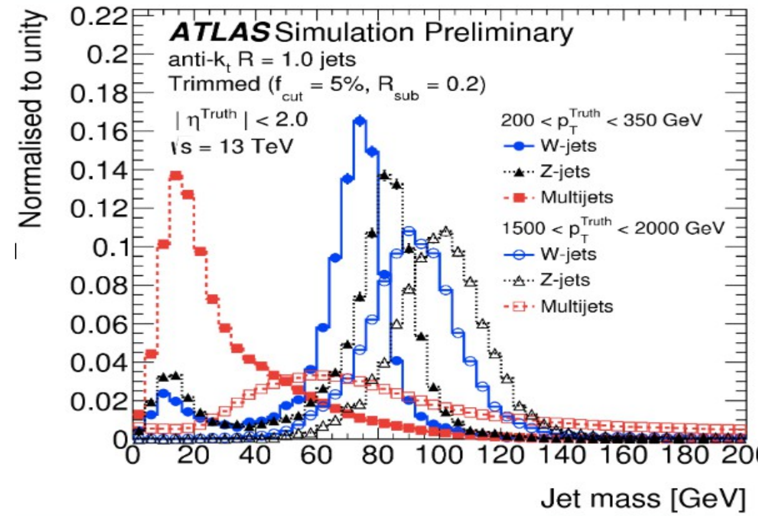
Energy correlation variables (*JHEP 1306 (2013) 108*)

- Energy correlations functions (ECFs) construct a complete representation of the jet by combining the p_T and angular separation of all jet constituents (ECF1), all pairs of jet constituents (ECF2) and triplets (ECF3)

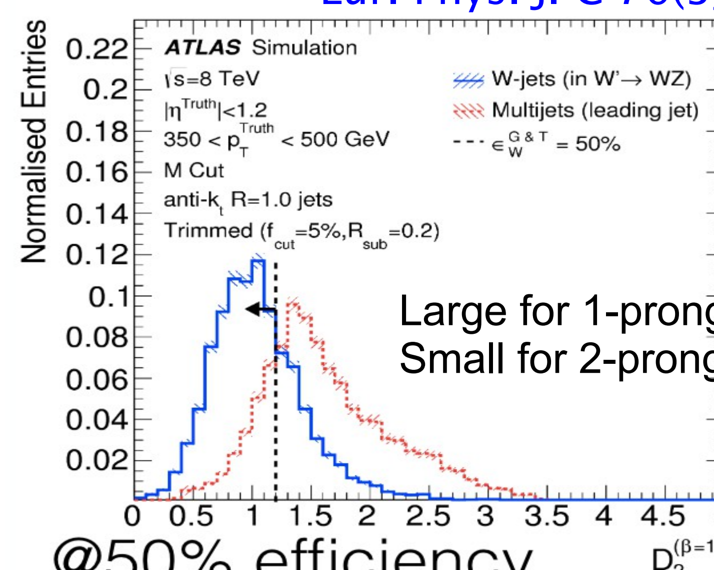
- Ratios of these are powerful in rejecting jets from multi jet processes

$$D_2^{\beta=1} = E_{CF3}\left(\frac{E_{CF1}}{E_{CF2}}\right)^3$$

ATL-PHYS-PUB-2015-033



Eur. Phys. J. C 76(3)



Large for 1-prong jet
Small for 2-prong jet

@50% efficiency

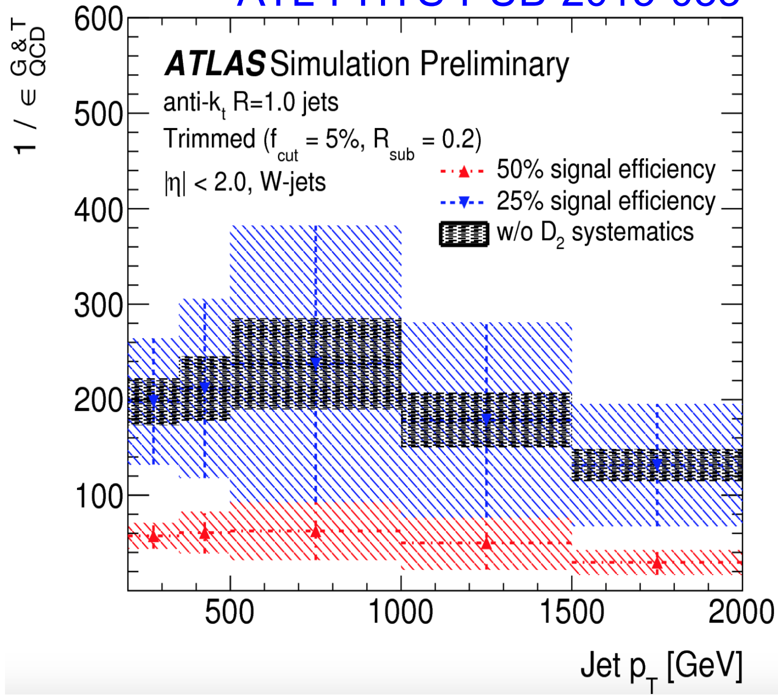
W/Z boson tagging for early Run-2

- **Huge optimization effort** at the end of Run-1: arXiv:1510.05821
- 4 sets of algorithms studied for Run-2, of which this is the most performant:

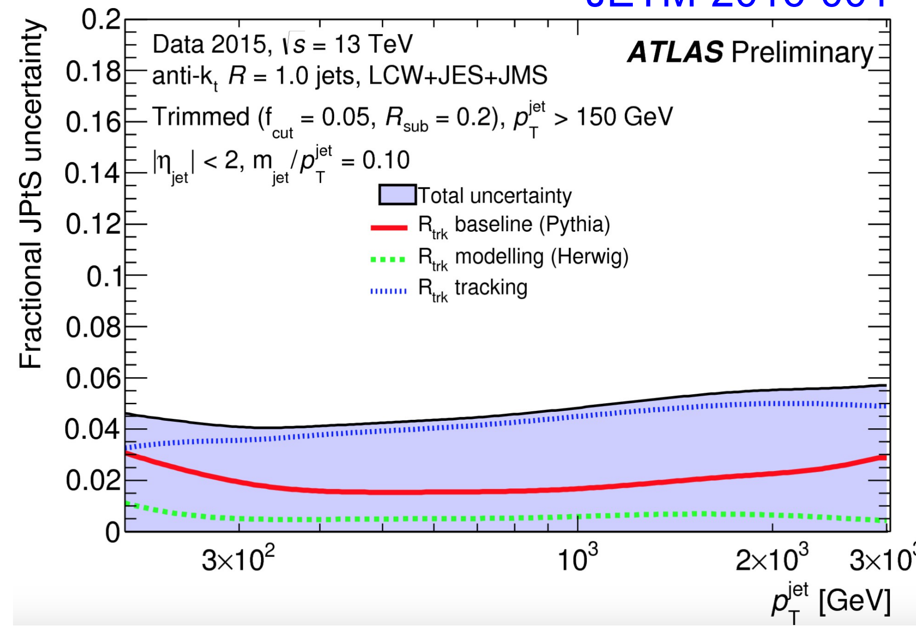
Mass and energy calibrated anti-kt jets with R = 1.0
Trimmed with fcut = 5% and Rsub = 0.2
Dynamic mass window cut (68%) + p_T dependent D2 cut for jets gives the best rejection (~90%) at 50% signal efficiency

- Uncertainties derived by comparing the measured calorimeter jet energy and mass to the same quantities measured by the tracker in both data and MC, using a double ratio method

ATL-PHYS-PUB-2015-033

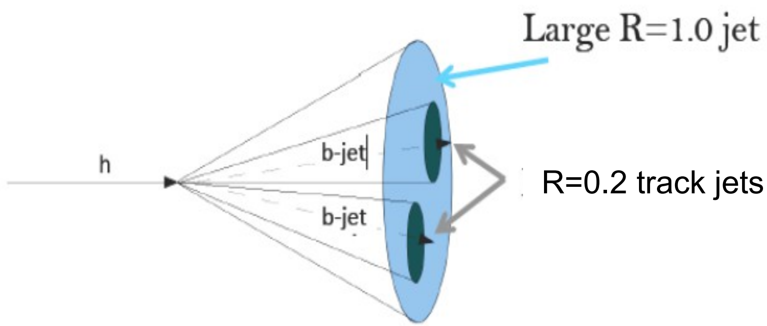


JETM-2016-001



H→bb boson tagging for early Run-2

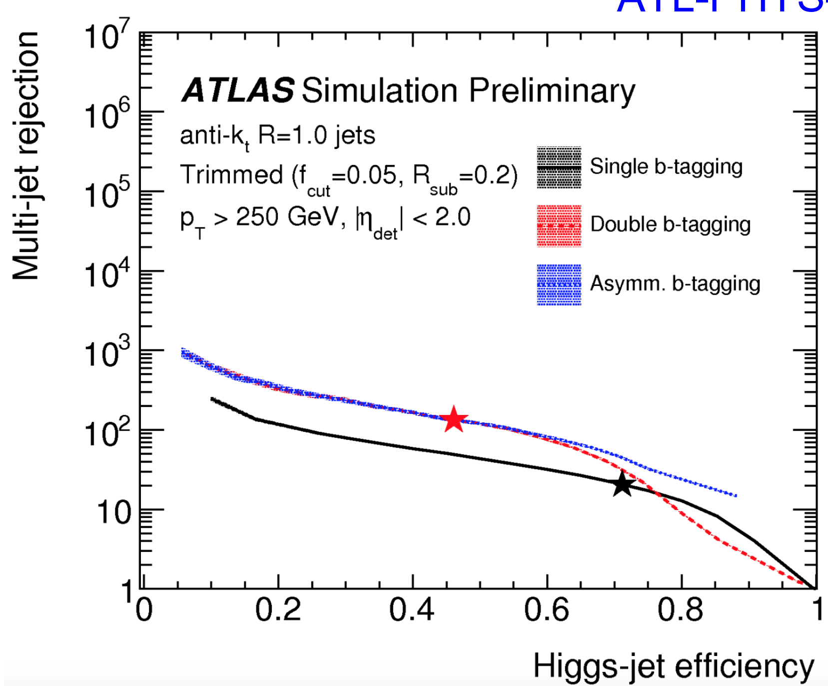
- **Tag small-radius** (R=0.2) jets made of tracks:
  - Match tracks directly to PV → pileup insensitive
  - Smaller radius jets for close-by b-tagging
  - Better resolution w.r.t. b-hadron direction than calo

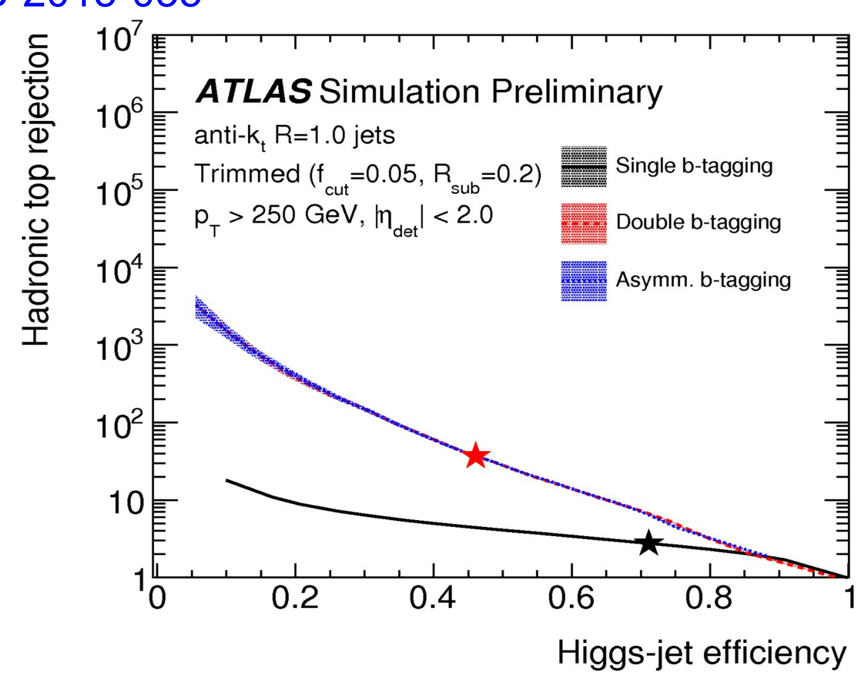


Mass and energy calibrated anti-kt jets with R = 1.0
Trimmed with fcut = 5% and Rsub = 0.2
Mass window cut + track-jet b-tagging (MV2c20 70% wp) + p_T dependent D2 cut (optional)

- Uncertainties driven by b-tagging (calibrated in Run-1 using ttbar events)

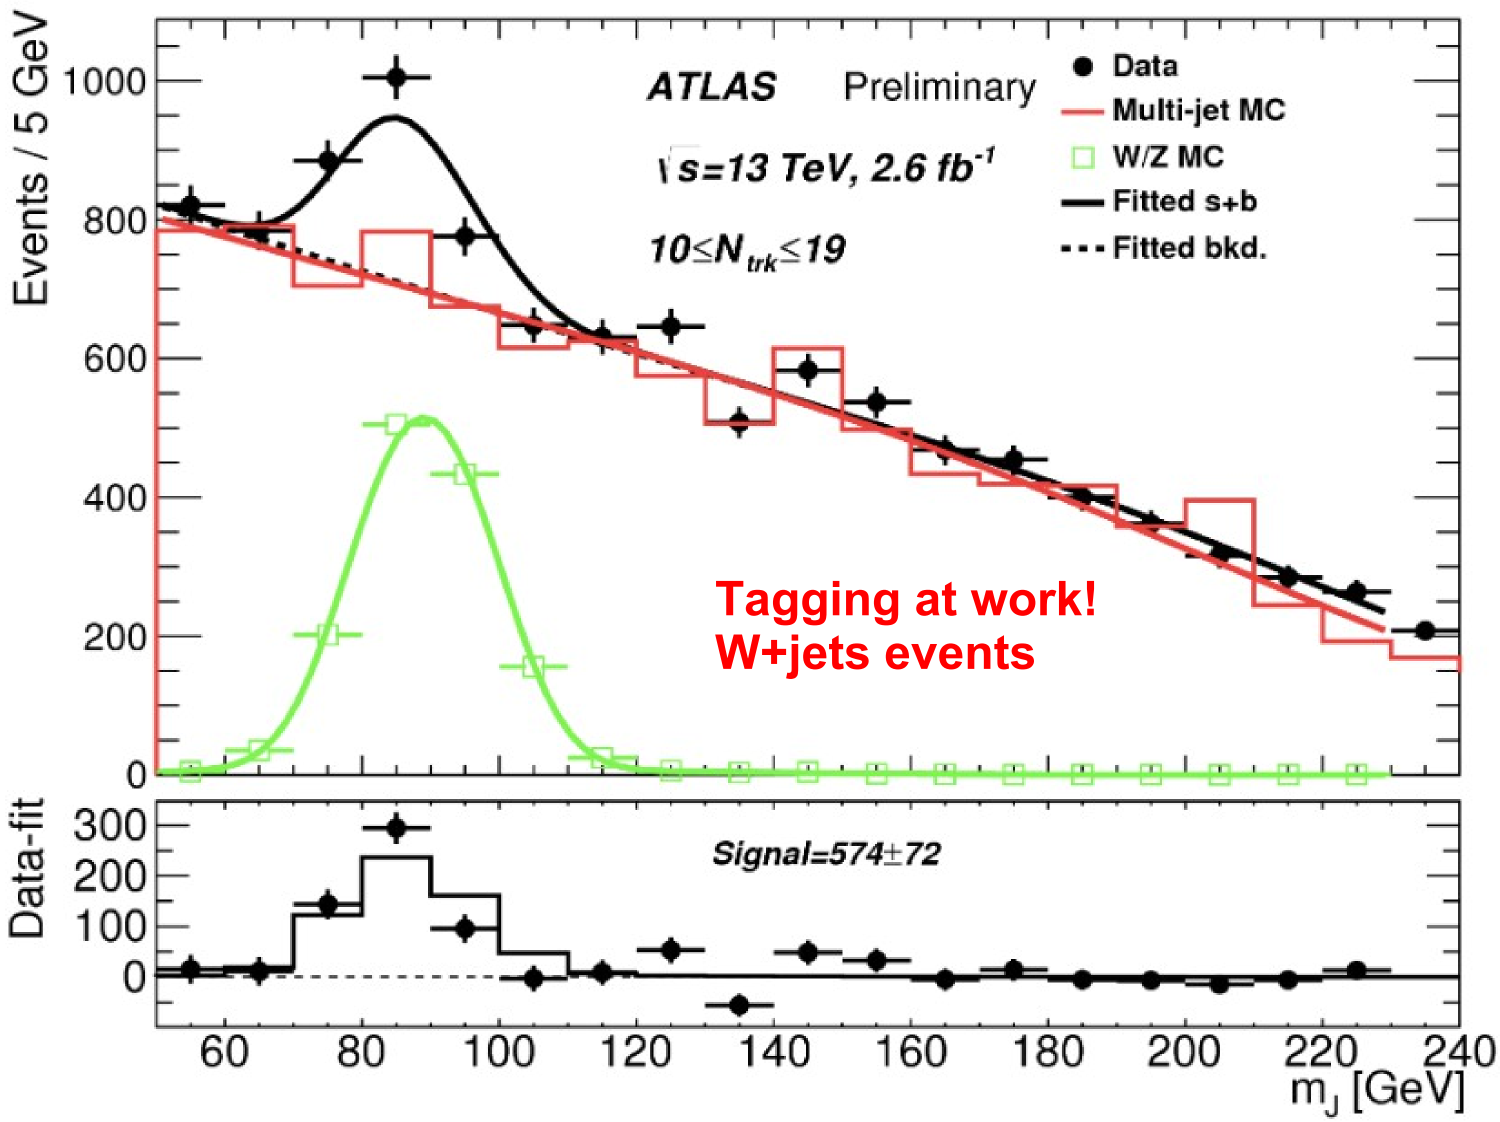
ATL-PHYS-PUB-2015-035





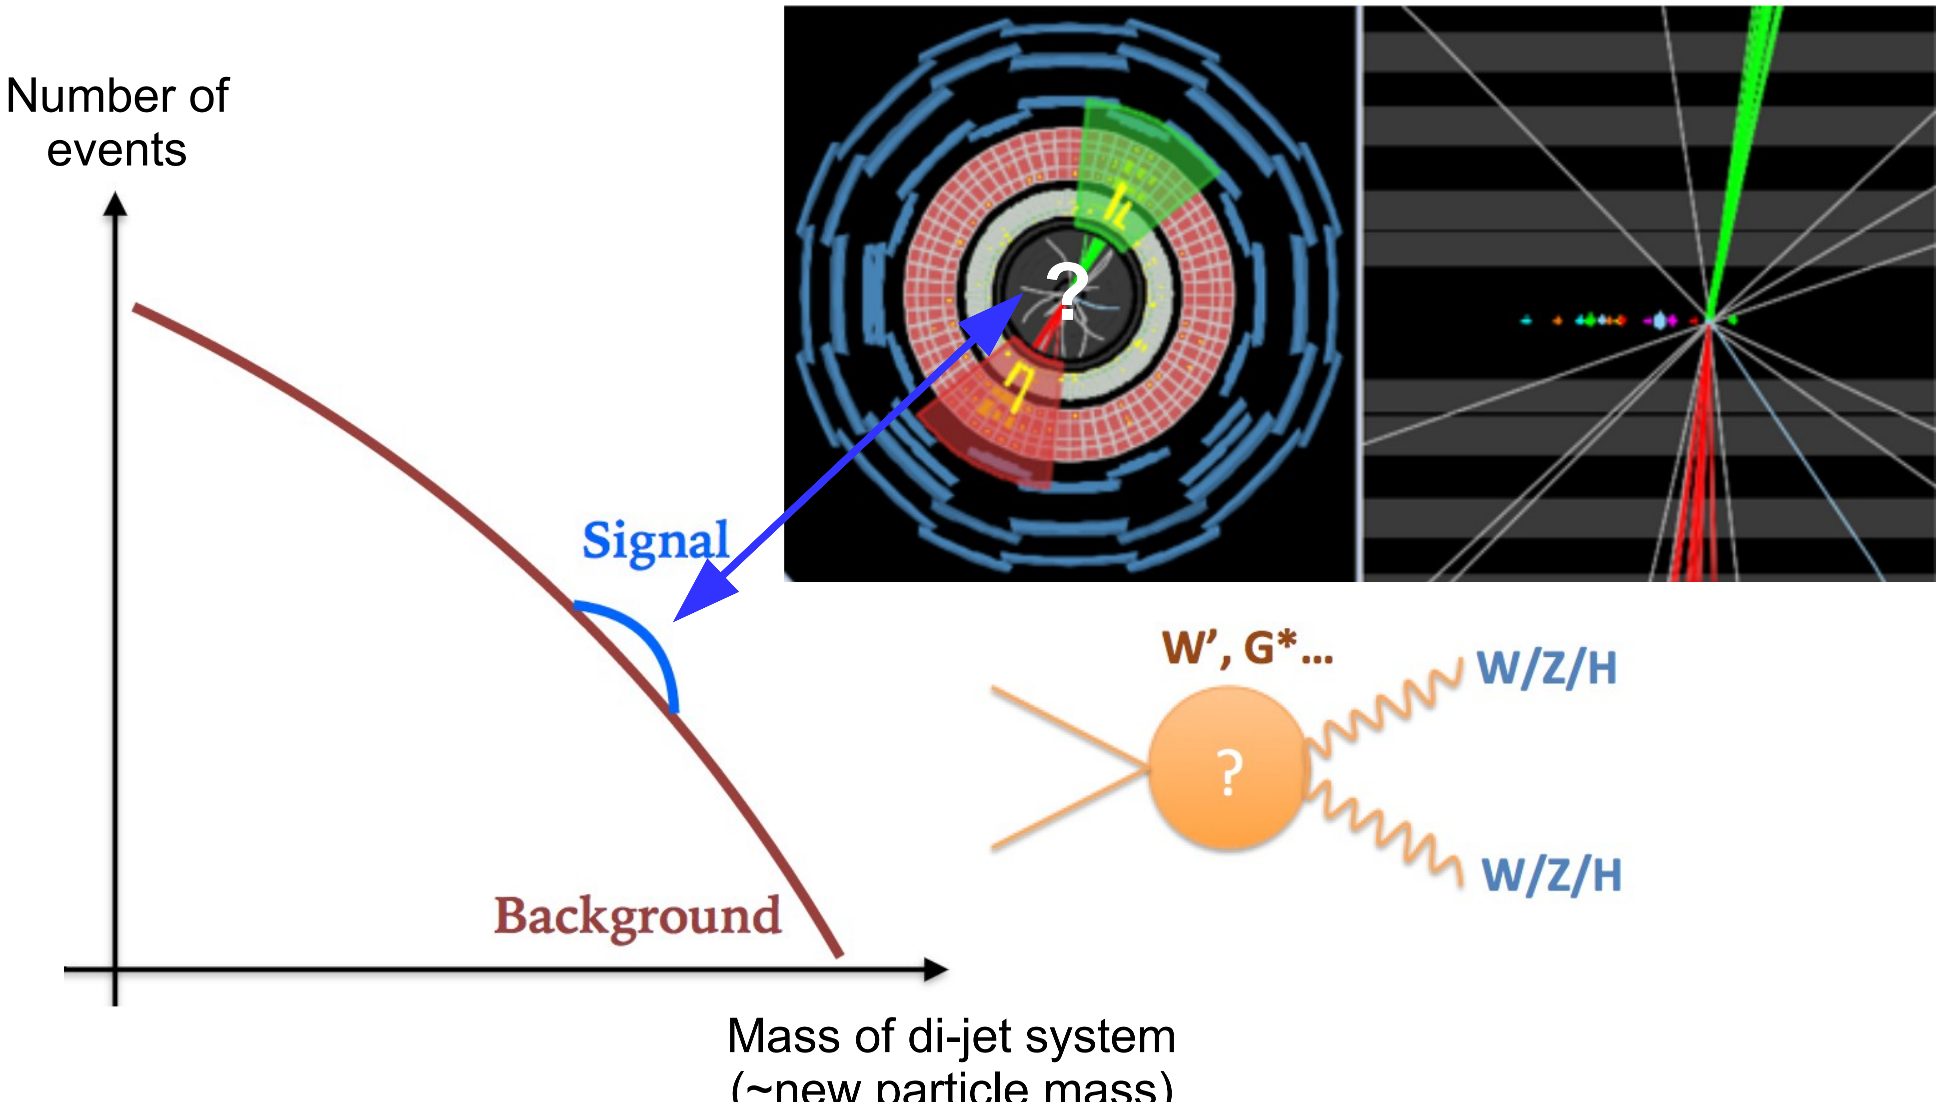
Boosted boson tagging at work

ATLAS-CONF-2015-073



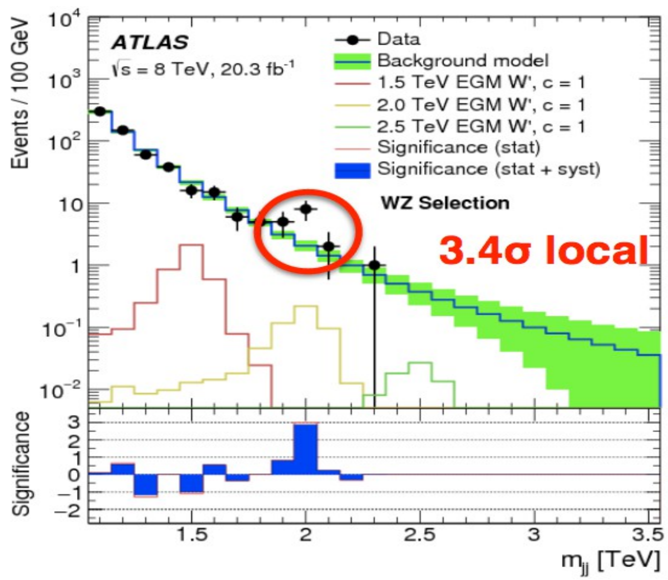
How would new resonances manifest themselves?

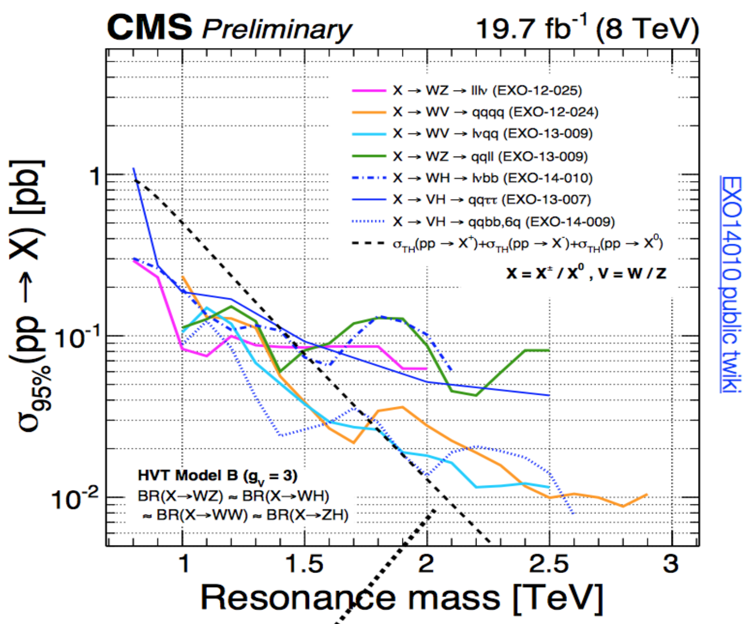
New particles: resonant excess (bump) over Standard Model background

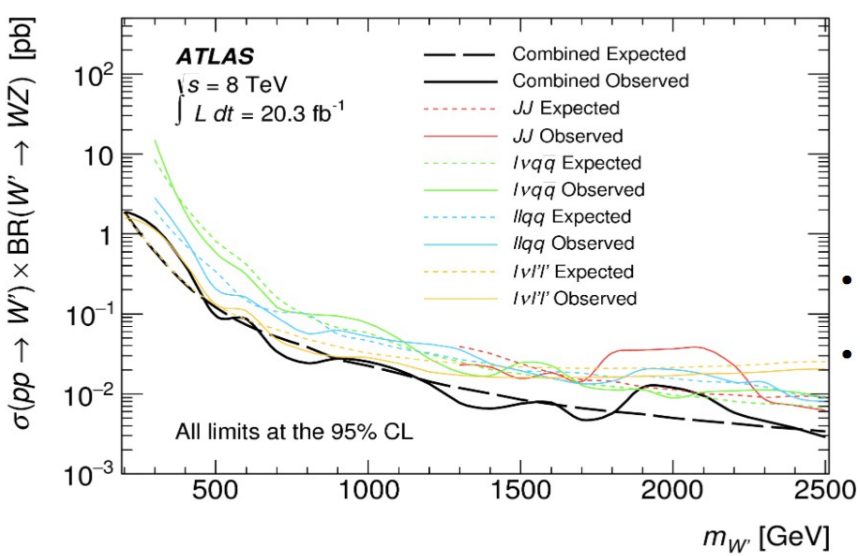


Some extra from Run-1: an analysis you might remember

- Fully hadronic channel observed a 3σ local excess with the Run-1 dataset arXiv:1506.00962v2
- CMS observed smaller deviations around 1.9 TeV EXOT14010



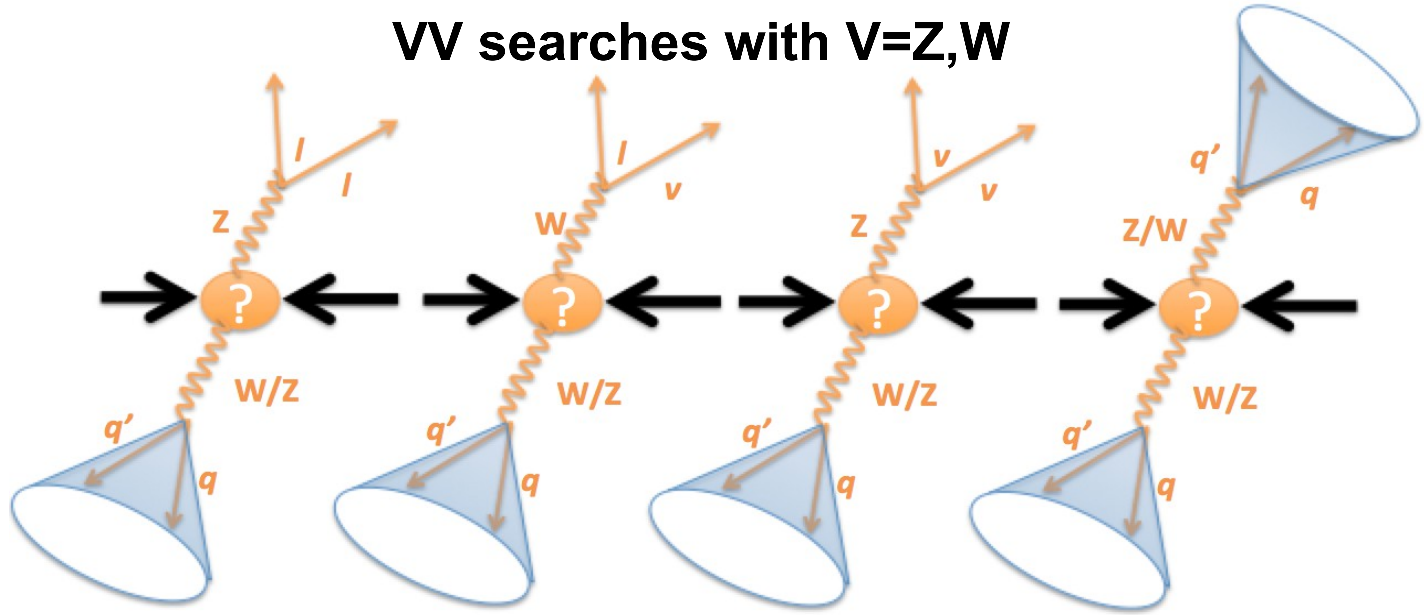




- Not seen by other channels in ATLAS
- ATLAS combination: arXiv:1512.05099

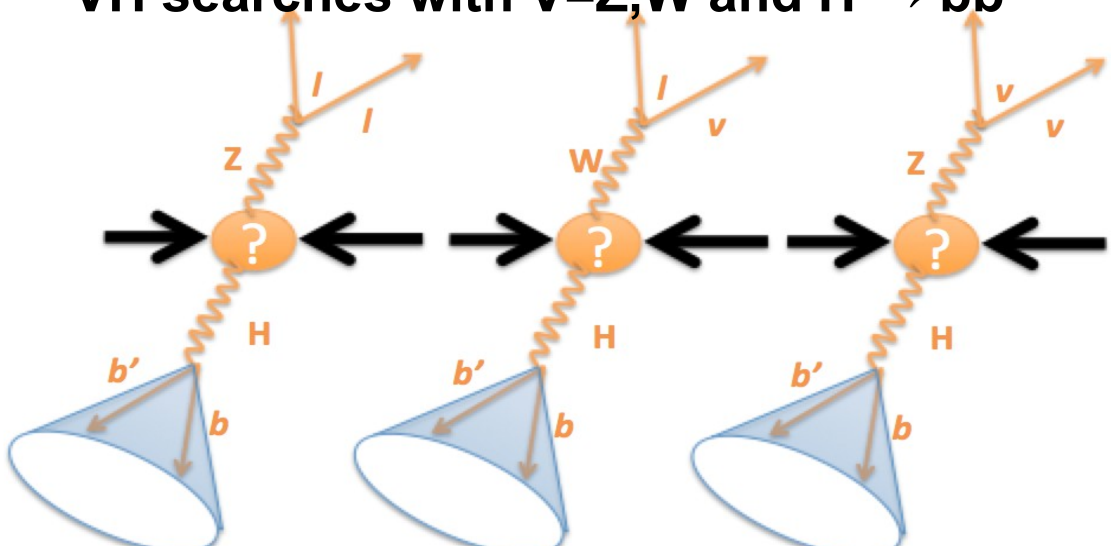
Quick review of the results

VV searches with V=Z,W



ATLAS-CONF-2015-071 ATLAS-CONF-2015-075 ATLAS-CONF-2015-068 ATLAS-CONF-2015-073

VH searches with V=Z,W and H → bb



ATLAS-CONF-2015-074

Analysis strategy

Get the objects:
- Identify particles
- Calibrate them if needed

Built distributions of interesting variables

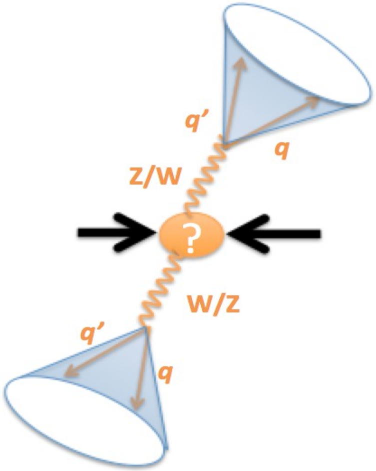
Search phase:
Compare data and background
Do you see any deviation?

No

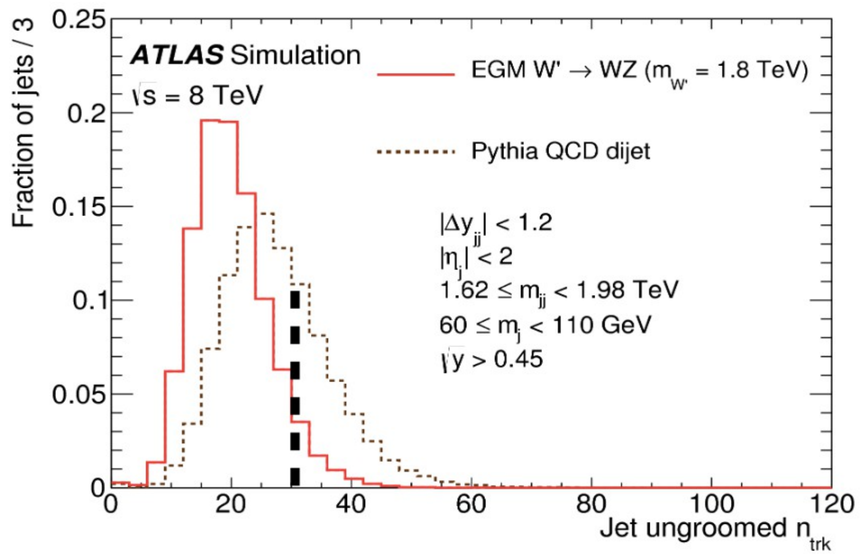
Limit setting phase:
Constrain new physics models

Yes

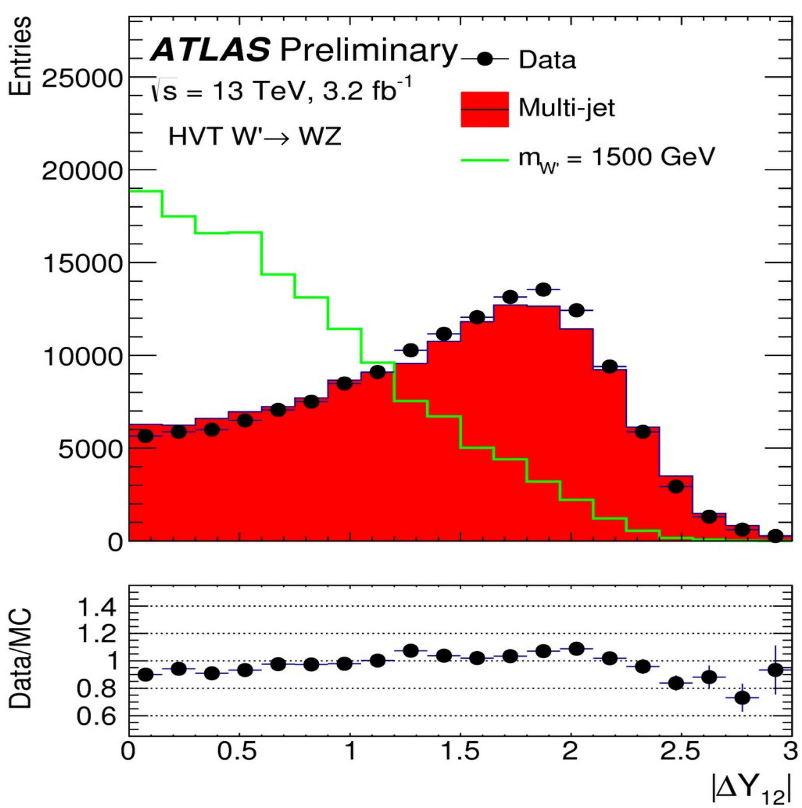
VV → qqqq: Selection



- **Entirely dominated by multijet background**
- **Two highest p_T jets (>450/200 GeV)** boson tagged
  - + Cut on number of tracks associated to the jet
  - 70% bkg rejection, 30% loss in signal
- $|y_1-y_2|<1.2$, p_T asymmetry <0.15
- Veto on leptons and E_T^{miss}
- 3 partially overlapping signal regions WW,WZ, ZZ



ATLAS-CONF-2015-073



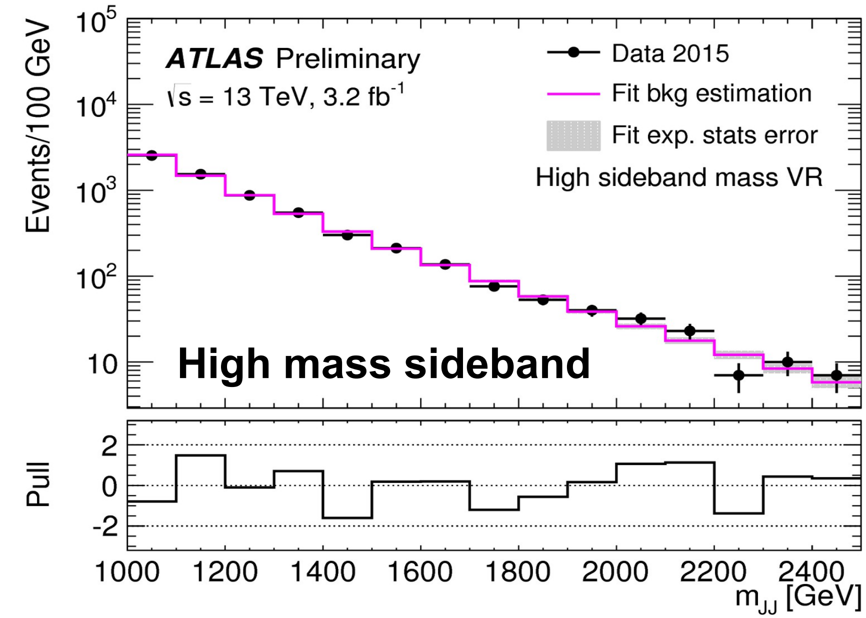
VV → qqqq: Background and signal regions

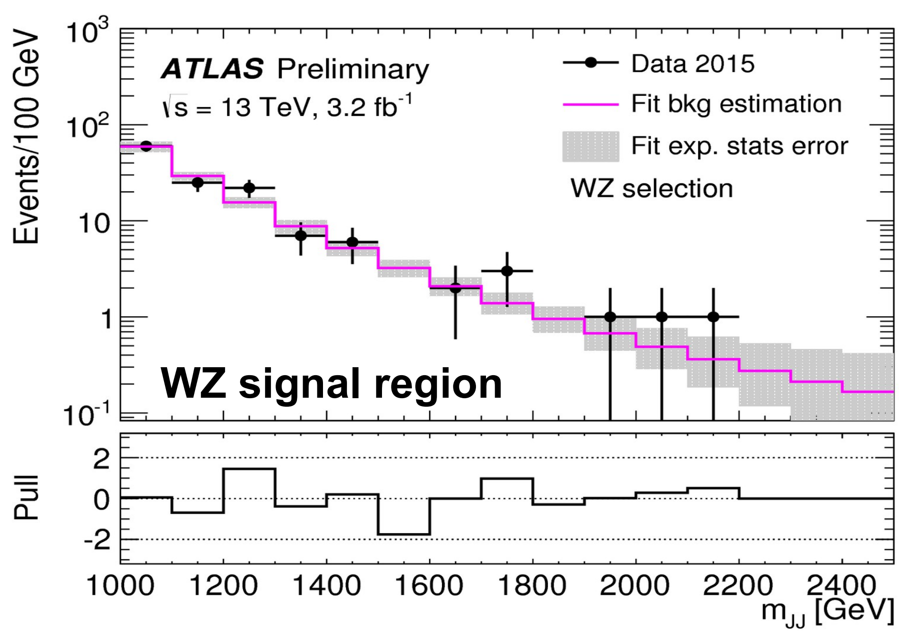
ATLAS-CONF-2015-073

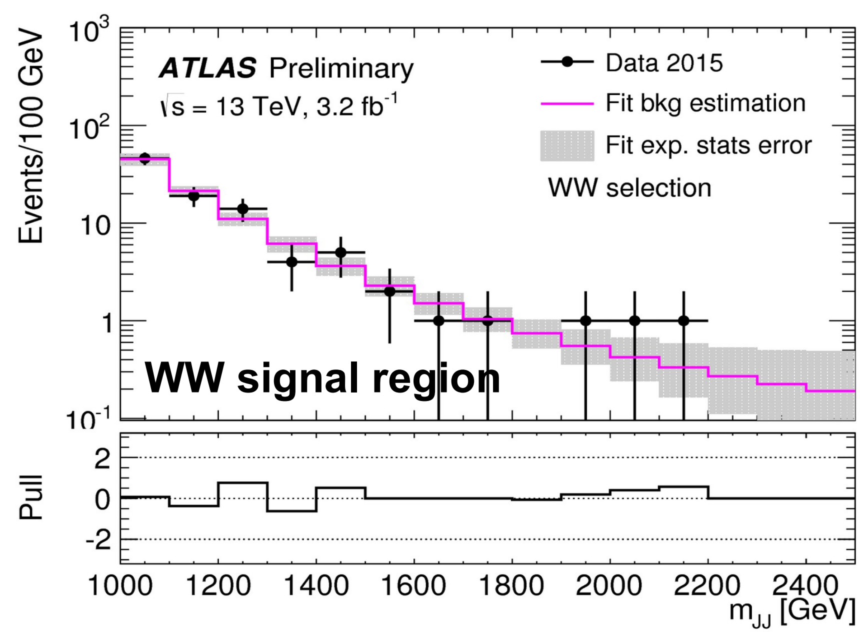
- Background estimated from fit to the data
  - Validation on simulation and checked against data in mass sidebands control regions

$$\frac{dn}{dx} = p_1(1-x)^{p_2+\xi p_3}x^{p_3}, x = \frac{m_{jj}}{13TeV}$$

- No significant deviation found
  - **Need more data!** But *gg* production disfavored
- Limits set on HVT (spin-1) and RSG (spin-2)

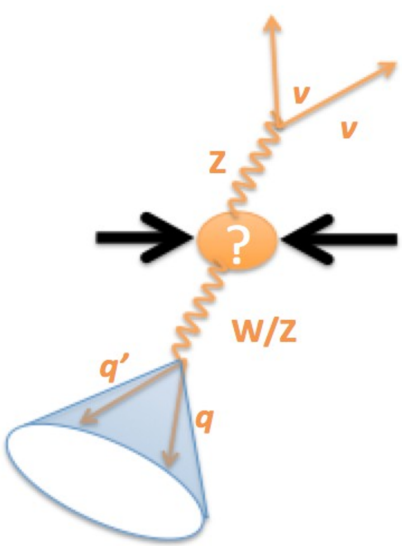




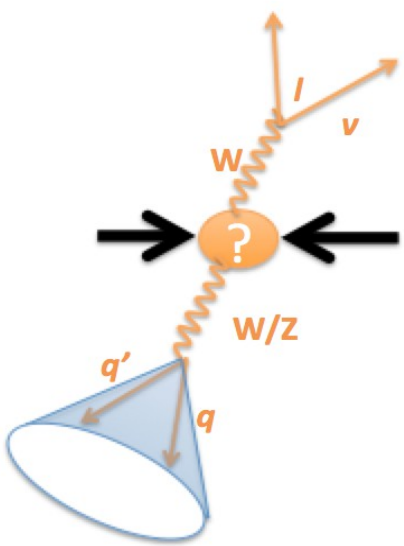


VV → llqq/lνqq/ννqq: Selection

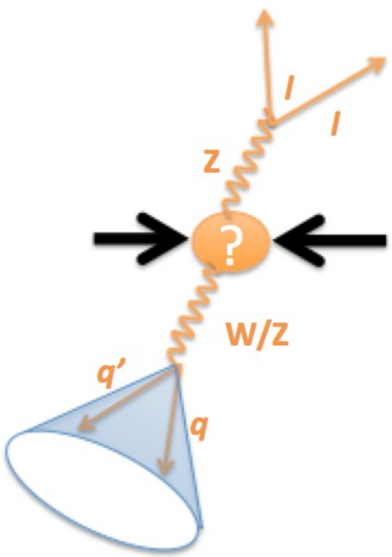
- 1 large-R jet with p_T>200 GeV boson tagged (mass + D_2 cut) @50% signal efficiency



High E_T^{miss}



1 lepton + E_T^{miss}



2 leptons and m_{ll} ~ M_Z

Main background:
V+jets, ttbar and Multijet

- min(Δφ(E_T^{miss}, jets))>0.6
- Δφ(E_T^{miss}, p_T^{miss})<π/2
- b-jet veto

Main background:
W+jets, tt and Multijet

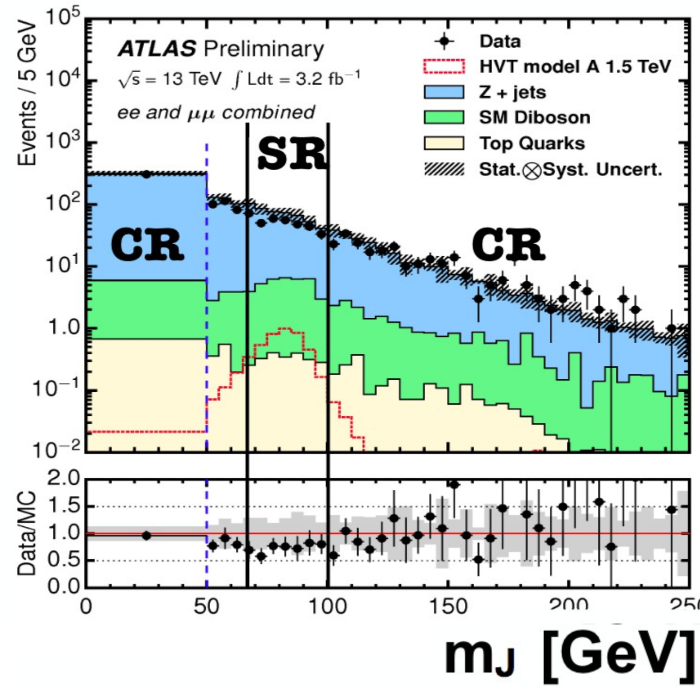
- E_t^{miss} >100 GeV
- p_T(W/J)>0.4*$m_{l\nu J}$
- b-jet veto

Main background:
Z+jets

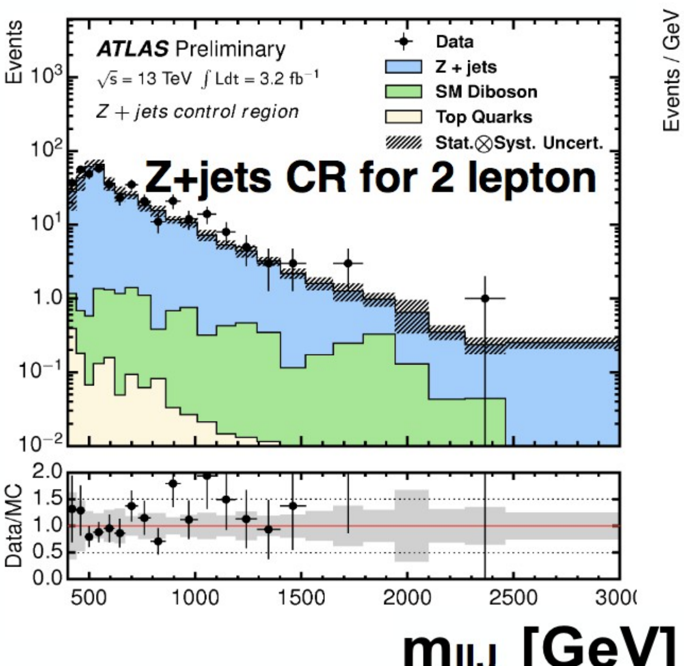
- p_T(Z/J)>0.4*m_{llJ}

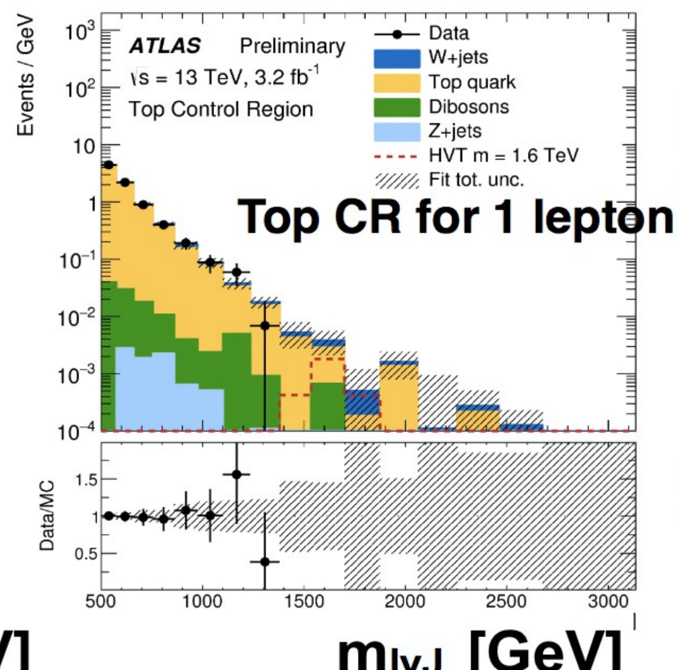
VV → llqq/lνqq/ννqq: Backgrounds

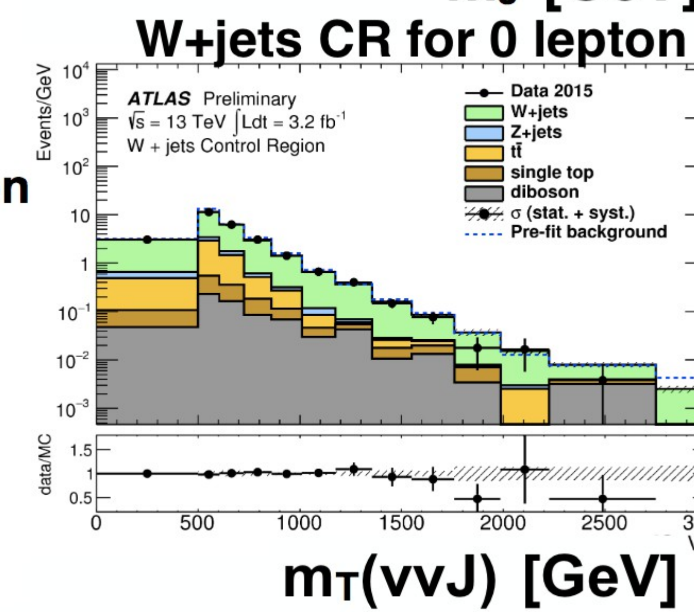
- Backgrounds are estimated using Monte Carlo simulation and checked in control regions defined using:
  - The jet mass sidebands for W/Z+jets
  - By asking additional number of b-jets in the event for ttbar



- Control regions are included in the final fit to better constrain the normalisation

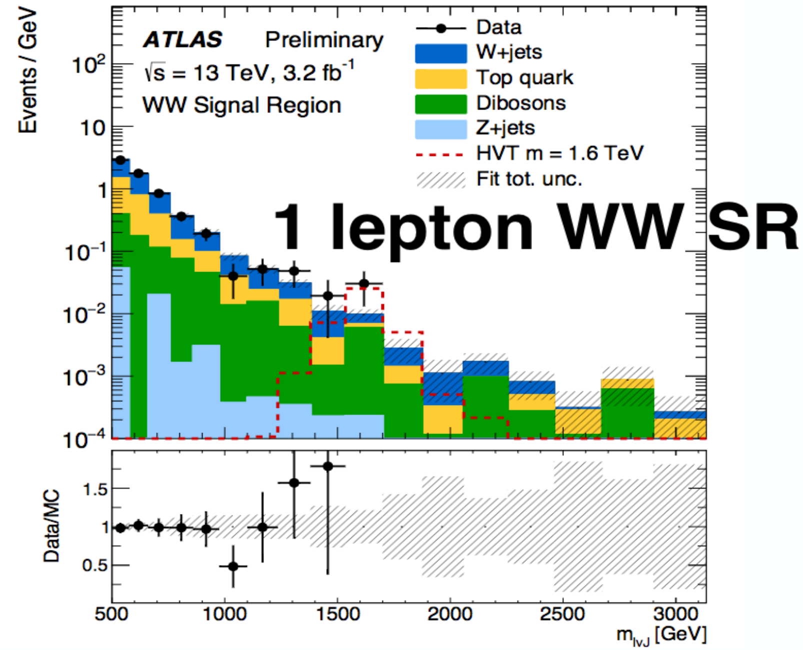


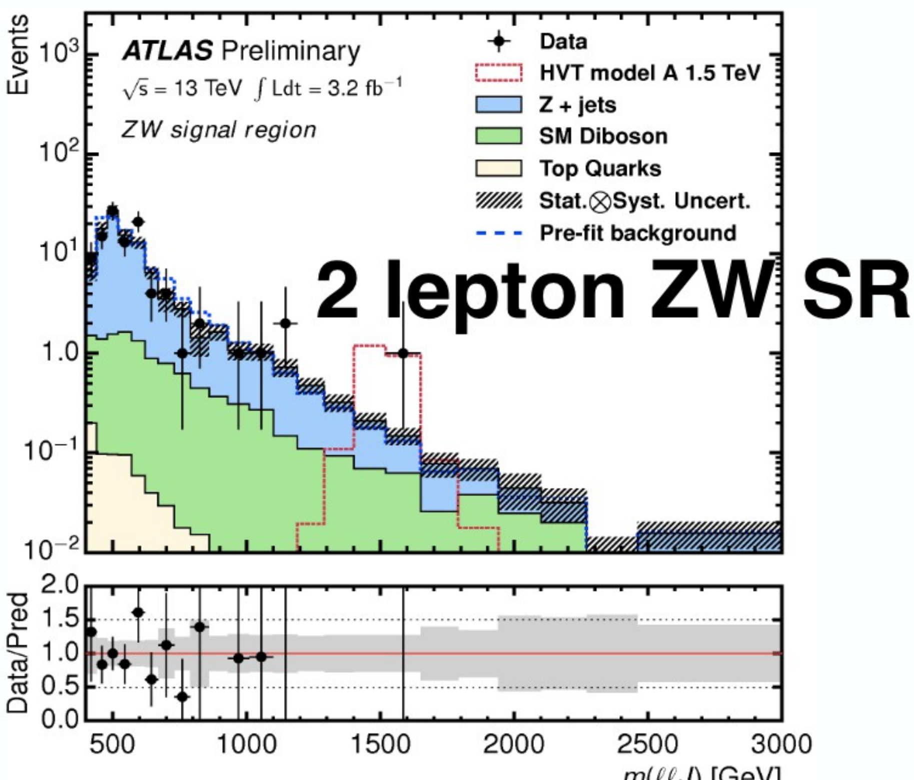


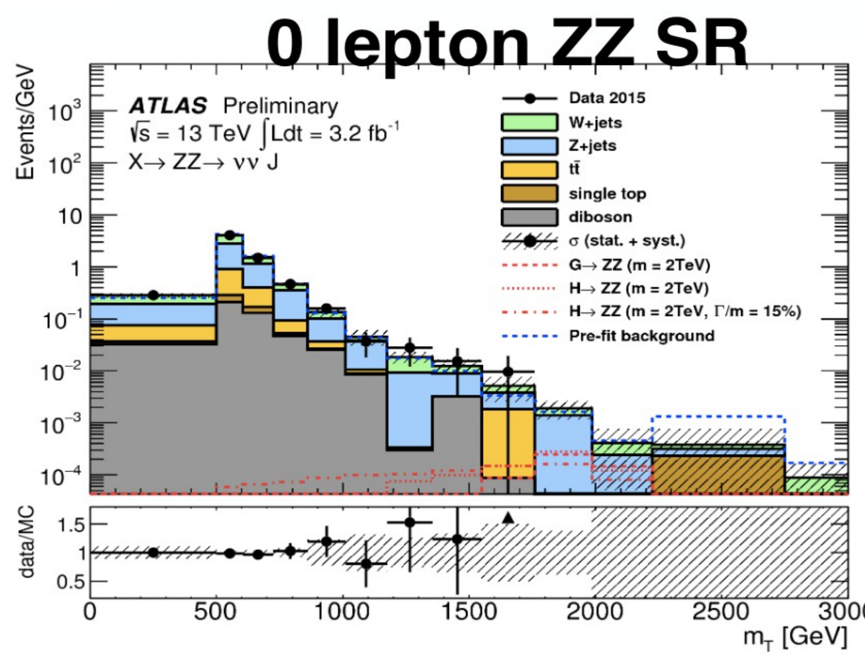


VV → llqq/lνqq/ννqq: Signal regions

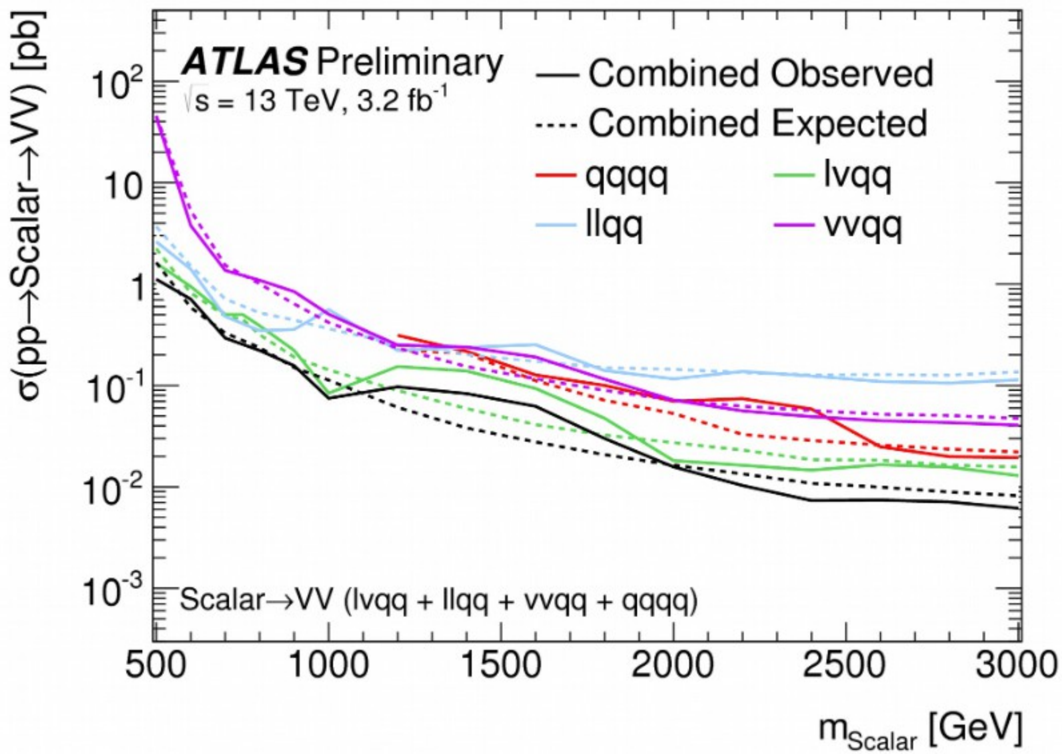
- Use m_{VV} ($m_{T,VV}$ for the ννqq channel) as a discriminant
- No significant deviation observed
- Limits set on HVT (spin-1), RSG (spin-2) and Heavy Higgs (spin-0)



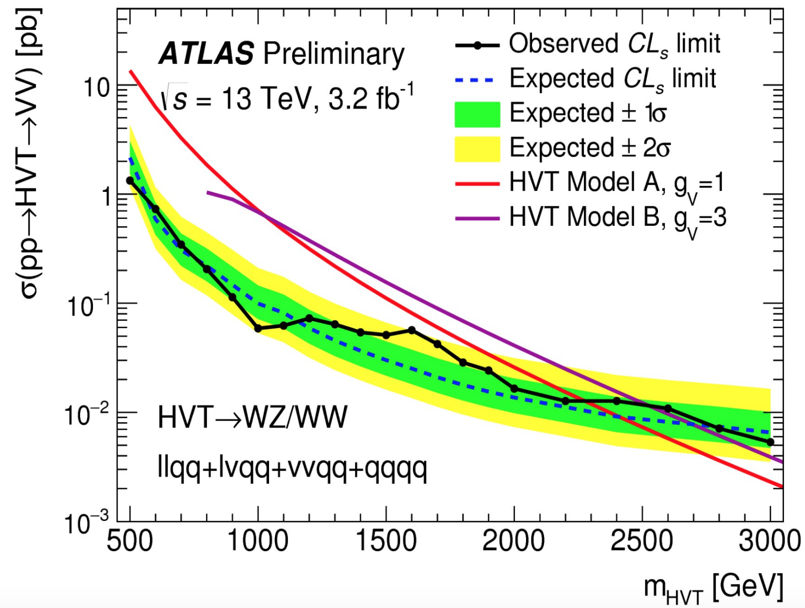


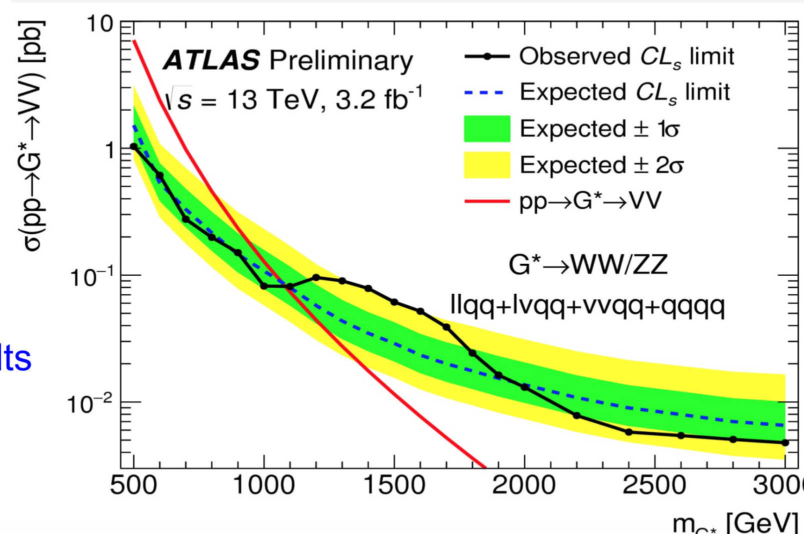


VV combination



https://twiki.cern.ch/twiki/bin/view/AtlasPublic/ExoticsPublicResults

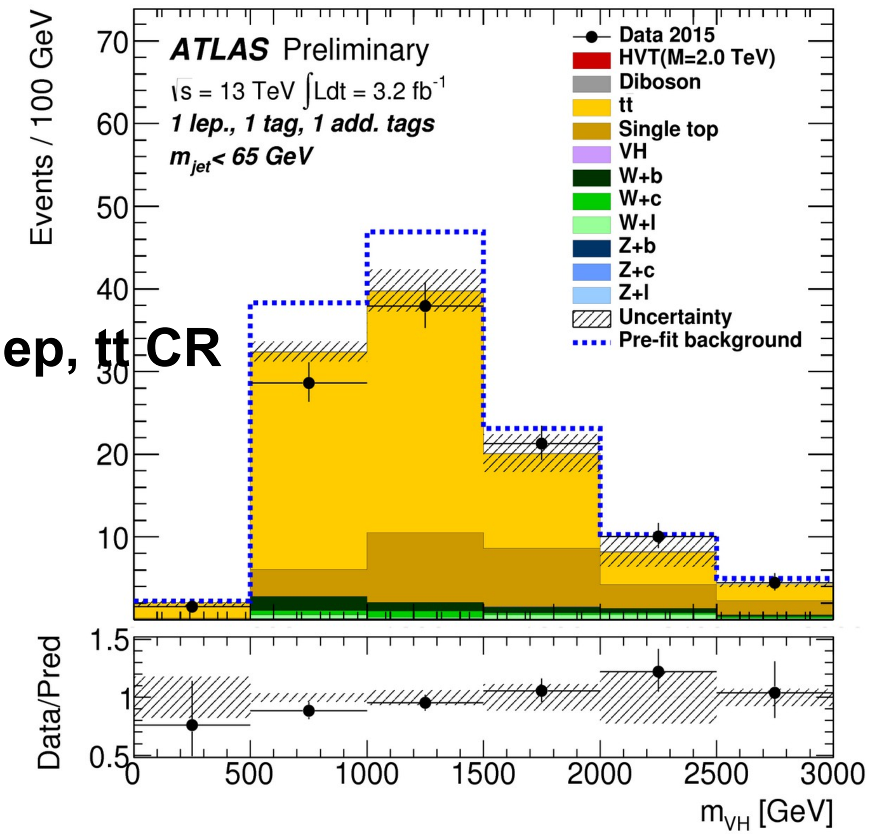




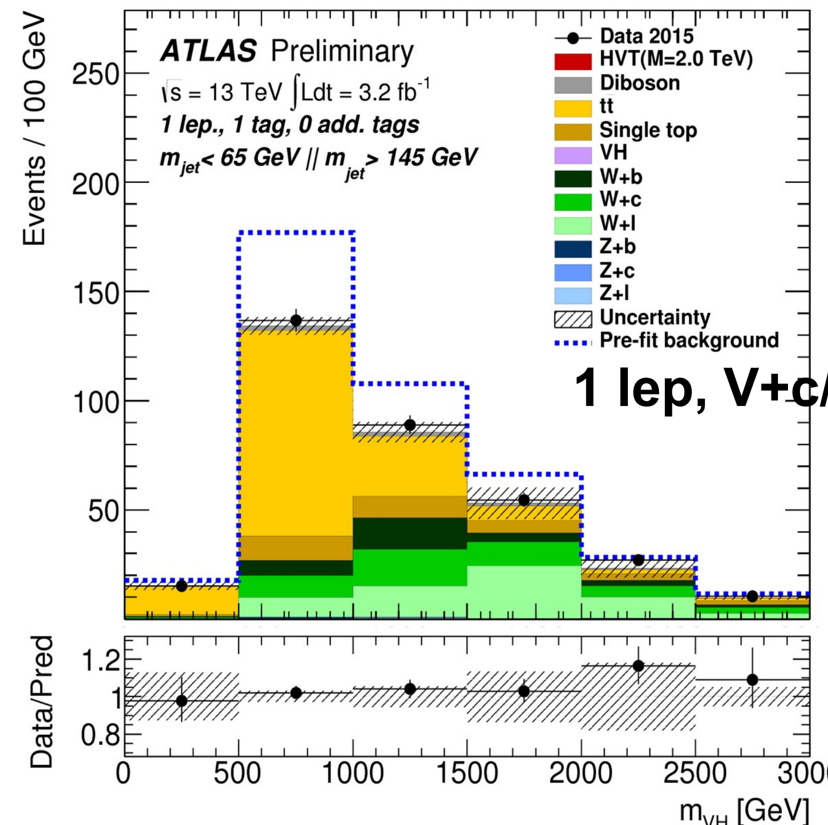
- Most extreme excess is 2.5σ for RSG... Global significance corresponds to 1.9σ
- Better sensitivity achieved for HVT/RSG at 2 TeV with 13 TeV data after combination (wrt Run-1)

VH → llbb/lvbb/vvbb: Selection and backgrounds

- Similar selection to the un-tagged (VV) analyses for the leptonic side
- Use H → bb boosted tagger on the hadronic side
  - 1 and 2 b-tag R=0.2 track jets categories
  - Higgs jet p_T>250 GeV
- Main backgrounds
  - Top and W/Z+heavy flavour
  - Estimated with simulation and checked in control regions



1 lep, tt CR

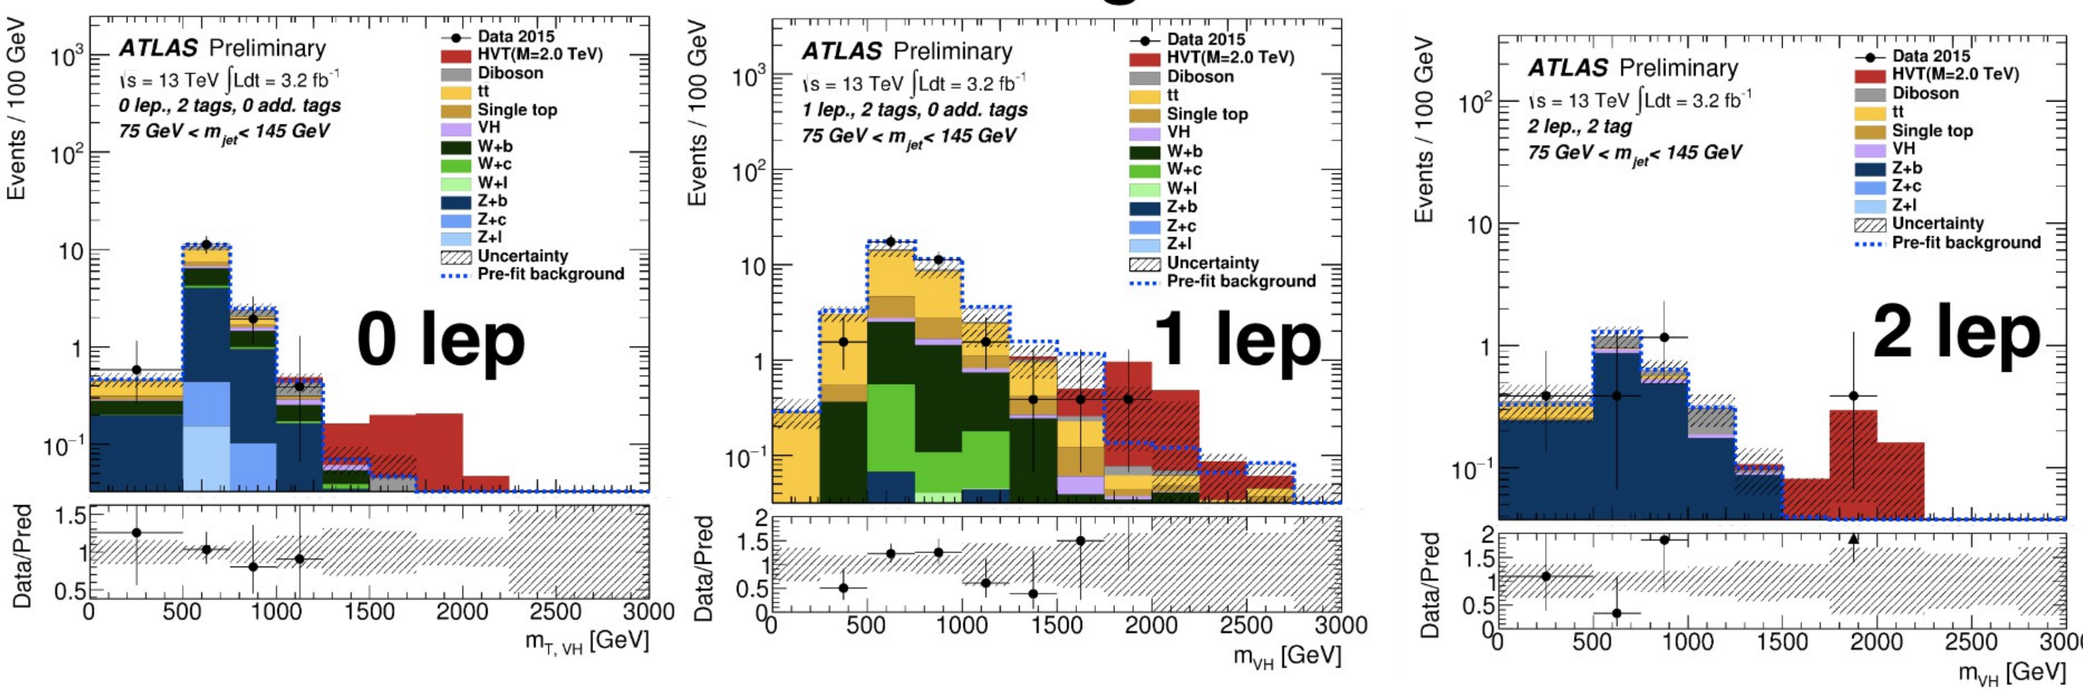


1 lep, V+c/tt CR

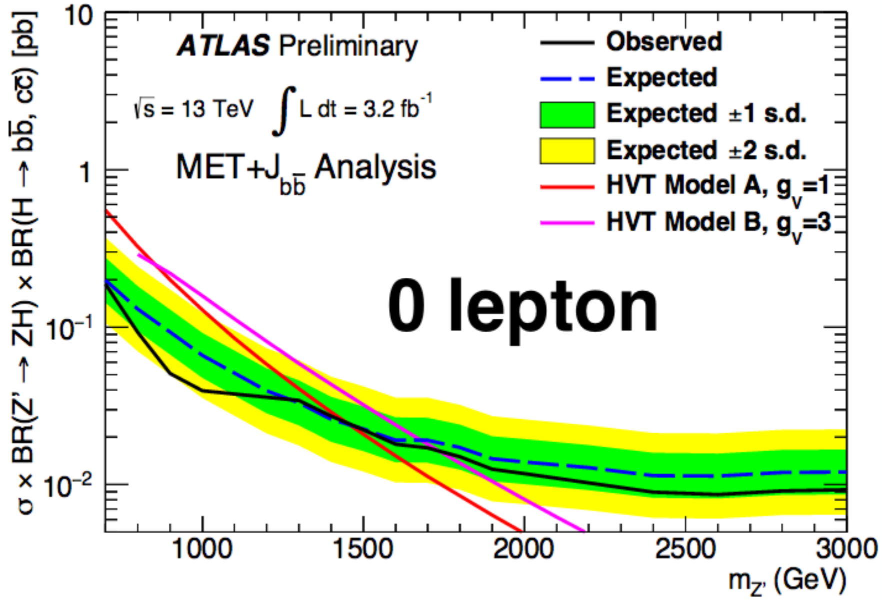
VH → llbb/lνbb/ννbb: Signal regions

- Use m_{VH} ($m_{T,VH}$ for the ννbb channel) as a discriminant
- No excess over the SM background
- Limits set on HVT models

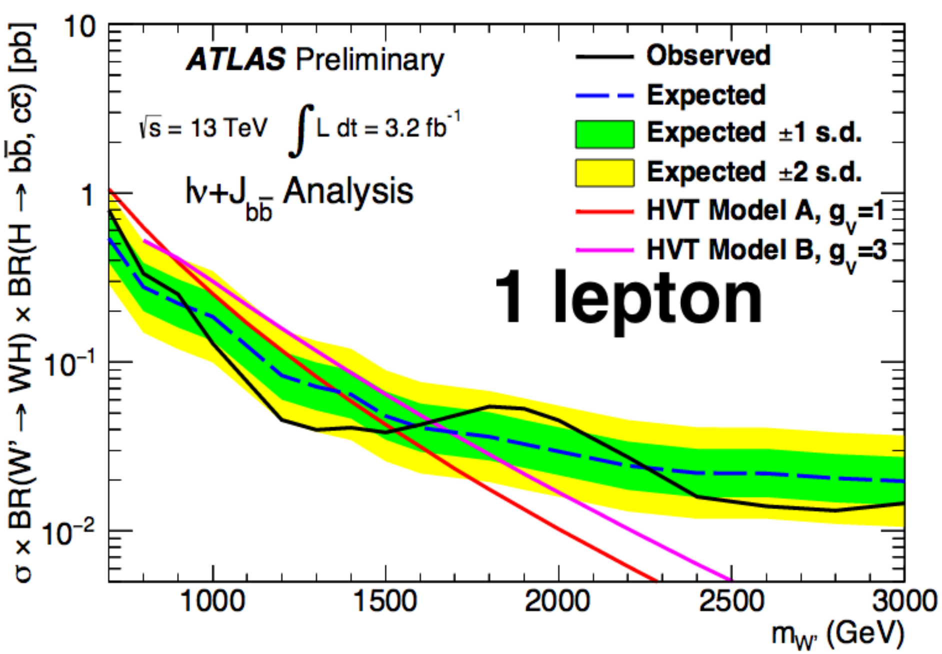
2-tag

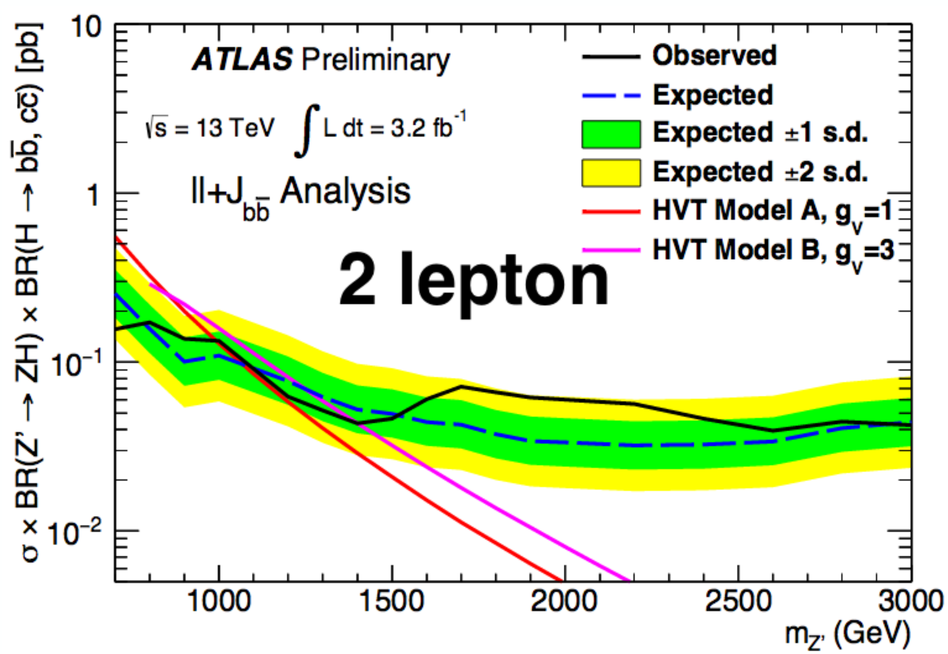


VH → llbb/lvbb/vvbb: Limits results



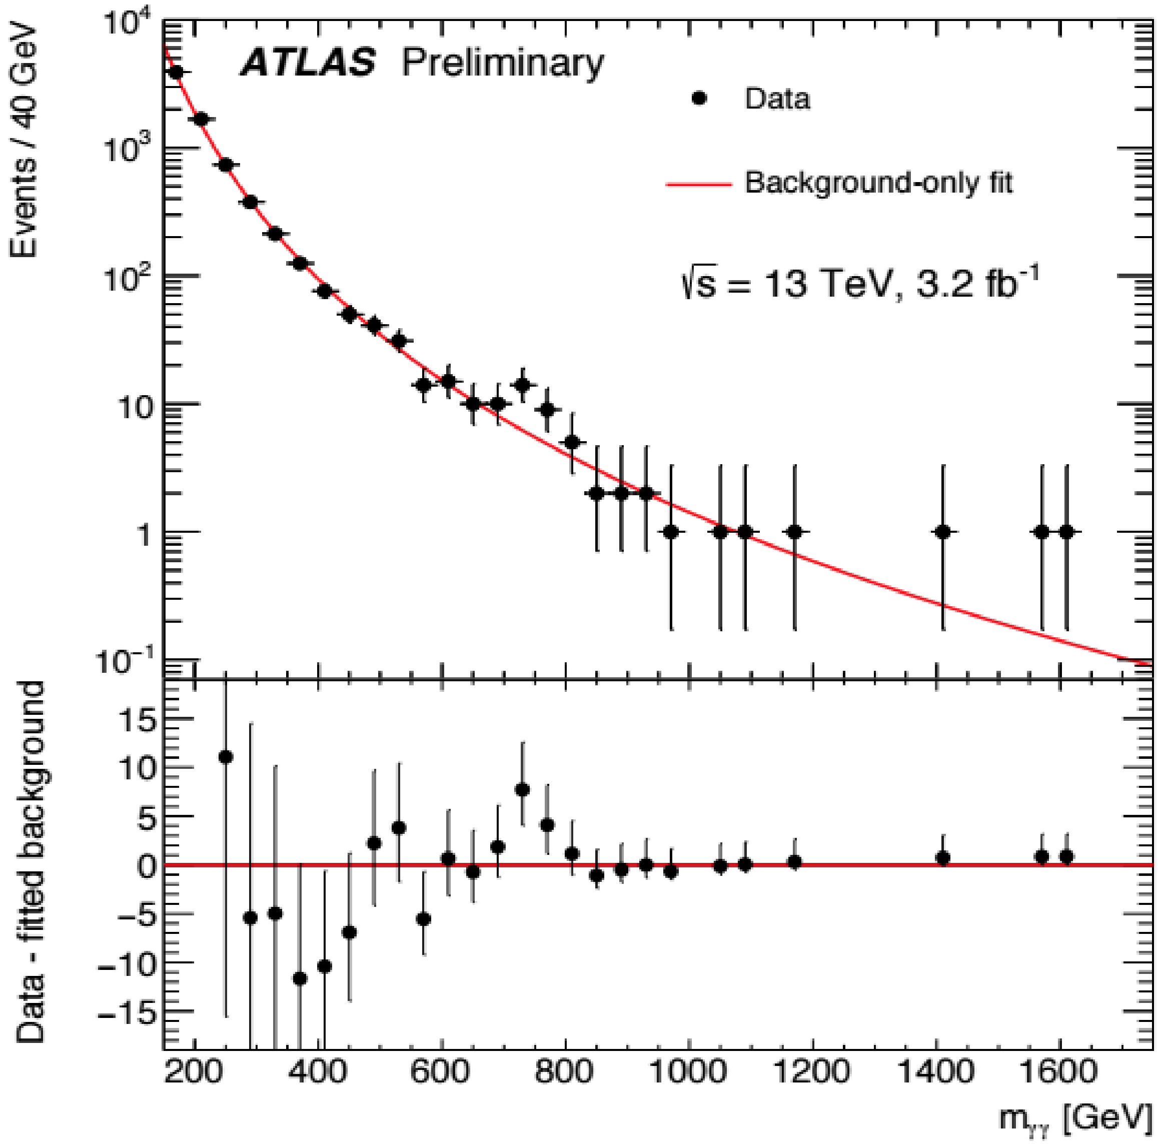
Set Limits for HVT:
model A and model B





Other intriguing results... diphotons at 750 GeV

Excess observed by ATLAS and CMS collaborations



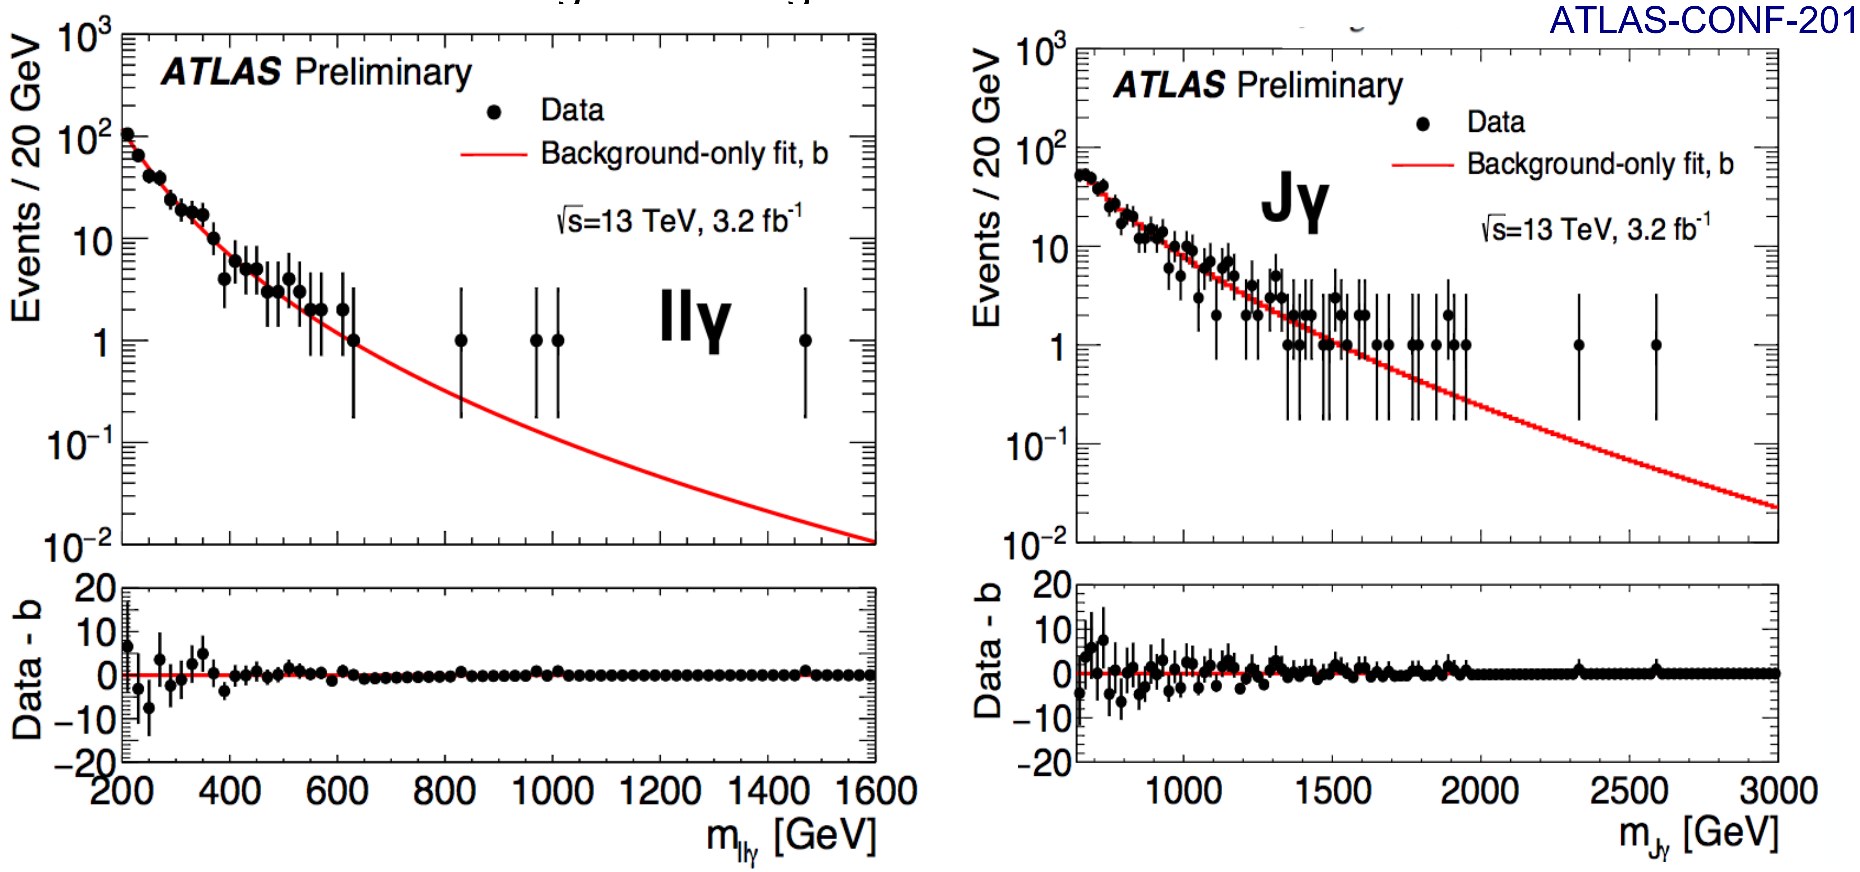
- So far excess have not appeared in other channels as VV, VH, dijets, etc...
- A sensible channels is γZ

2015 Zγ resonance search

- Leptonic analysis: Z→ee, μμ (BR=6.7%)
- Hadronic analysis: Z→qq (BR=70%), in boosted regime (p_T^{γ} >250 GeV)
- Main backgrounds:
  - Leptonic analysis: non-resonant Z+γ (~90%), Z+jet with jet→γ misID
  - Hadronic analysis: γ+jet (~90%), multi-jet; V+jet backgrounds (V=W,Z)

- Jet → γ bkg suppressed by photon ID and isolation criteria
- Final discrimination from signal looking at invariant mass of final state

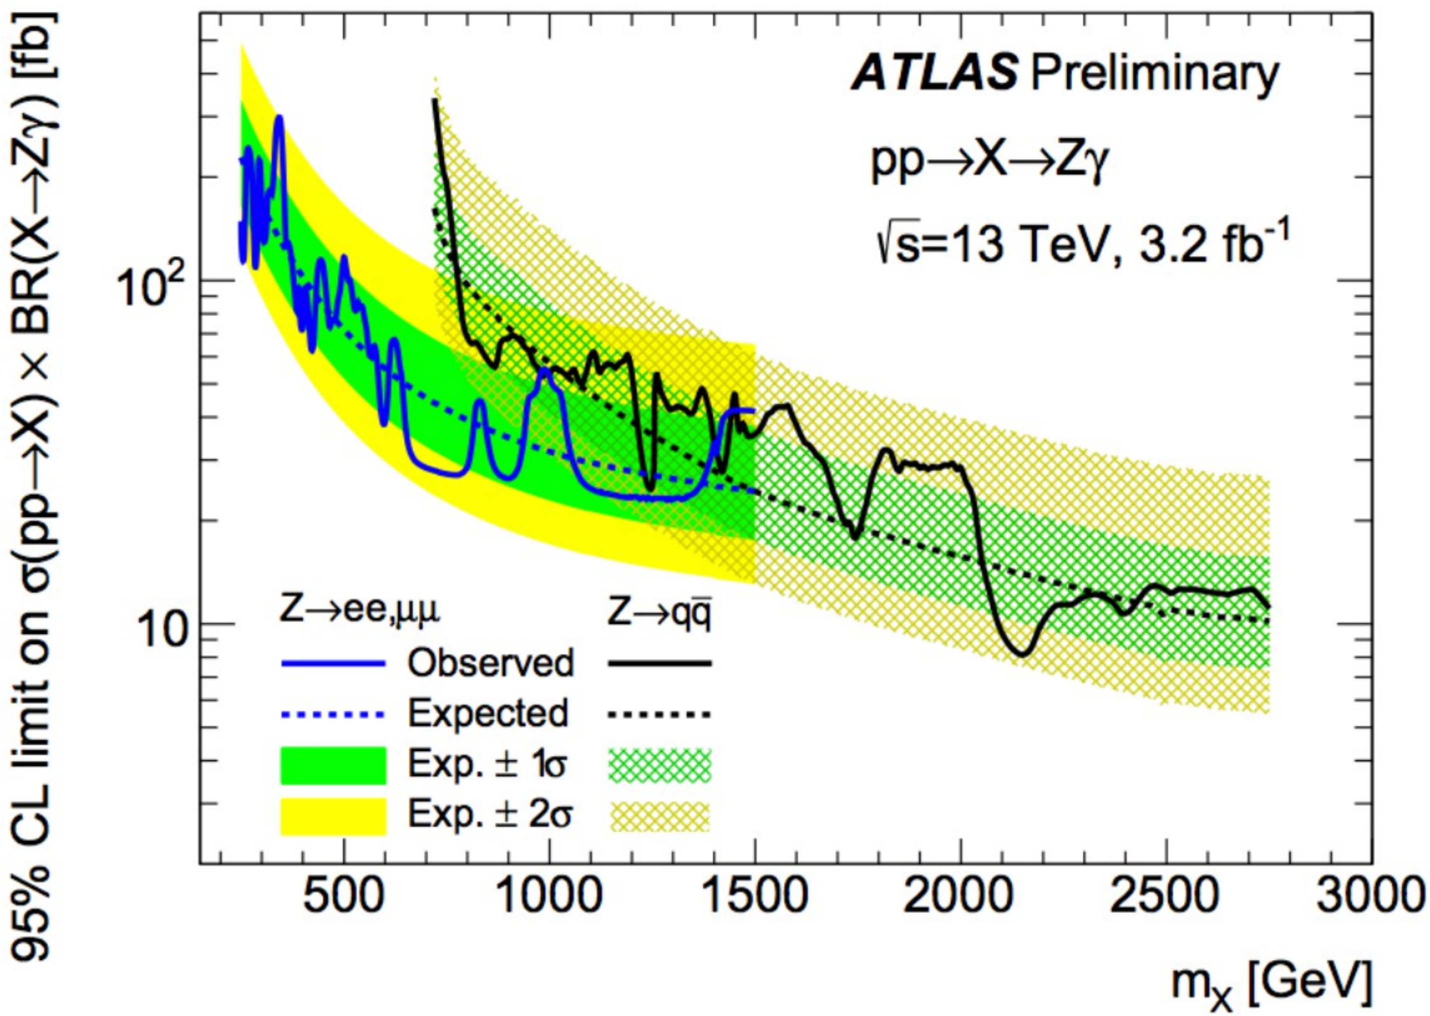
ATLAS-CONF-2016-010



2015 Zγ resonance search

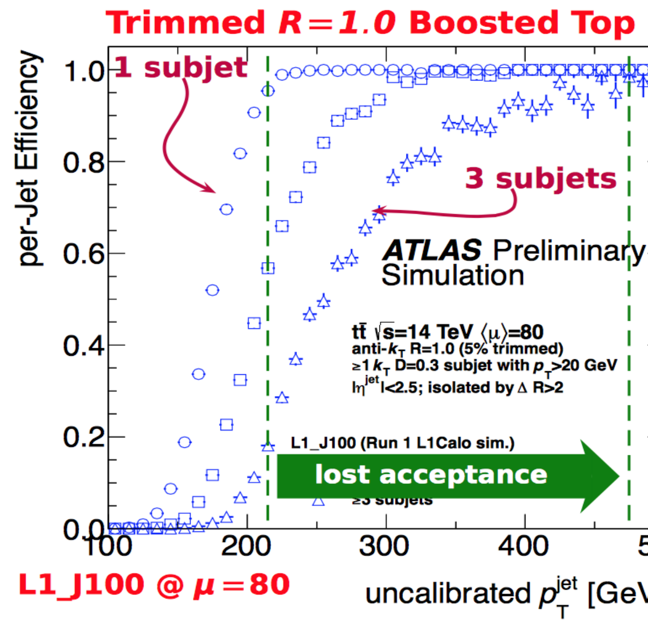
- Limits set on σ(pp→X)*BR(X→Zγ) assuming scalar X produced in gluon fusion
- Observed limits between 295 fb for m_X = 340 GeV and 7.5 fb for m_X = 2.15 TeV

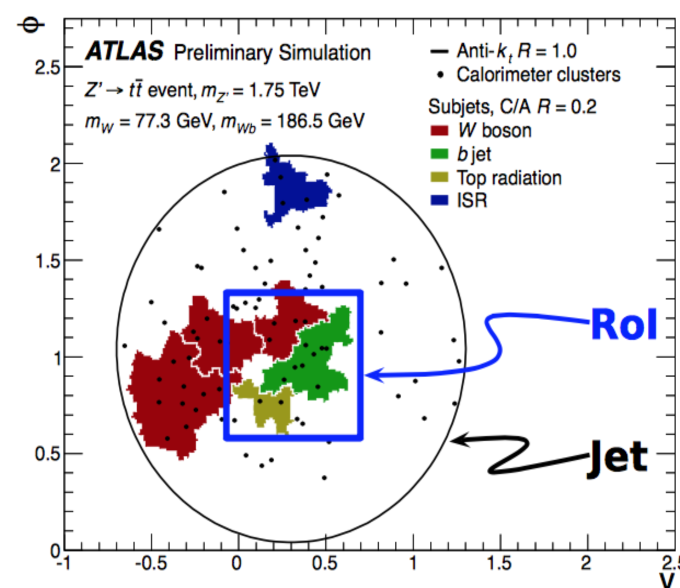
ATLAS-CONF-2016-010



Looking into the future
ATLAS Run-3 boosted objects trigger development

- Hadronic decays of high p_T bosons and fermions is a vital part of the ATLAS physics program
  - Isolated lepton triggers inefficient for some analyses → use jet triggers (e.g. VV → qqqq)
- Many techniques to suppress PU and to identify substructure in jets are implementable in the ATLAS High Level Trigger (HLT)
  - Large-R acceptance in HLT depends on the L1 requirements
  - But adding these in the level-1 hardware-based trigger is more complicated
- **ATLAS** is planning **major detector updates in Run-3, like Level-1 trigger (calorimeter) system**
  - Including the Global Feature Extractor (**gFEX**)
  - Institutions: ***BNL***, UChicago, Indiana, Pittsburgh, Oregon and Stockholm

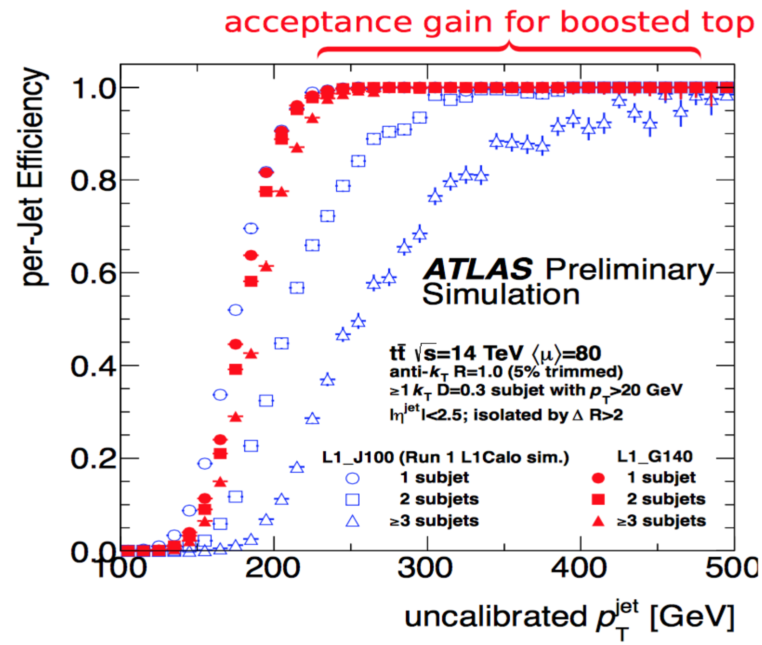


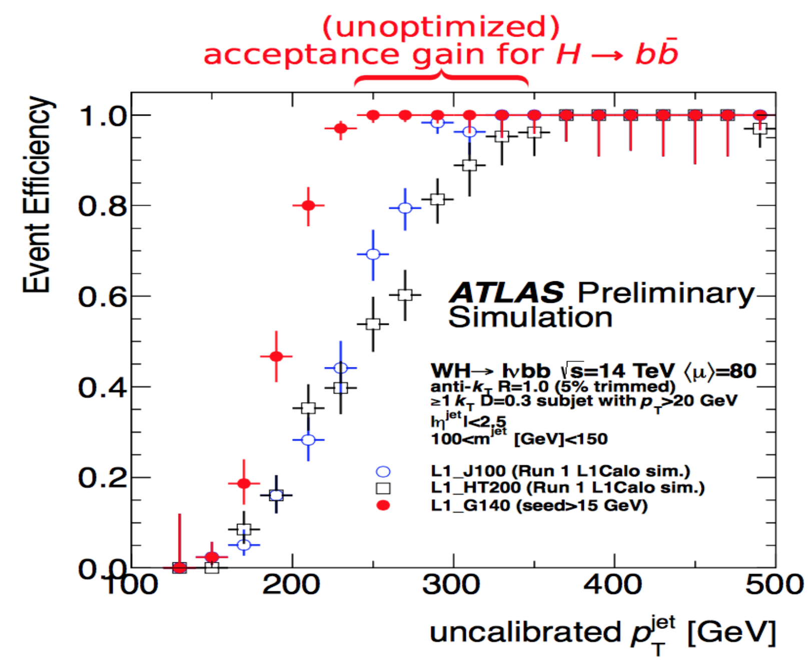


Nice overview in M. Begel's talk at BOOST15

Global Feature EXtractor (gFEX)

- **gFEX** is a single board that will have access to the information from the whole calorimeter!
- Will **identify events with large-radius jets**
  - Improving acceptance for boosted objects
  - Jet-level pile-up substraction
  - Substructure variables could be used
- Will calculate global event variables:
  - E_T^{miss}, centrality
- Implemented in a highly parallelized structure (3 large Xilinx Ultrascale FPGAs and Zync System-On-Chip)
- Prototype is available. Initial **LAr calorimeter-L1Calo link speed communication tests very successful!**

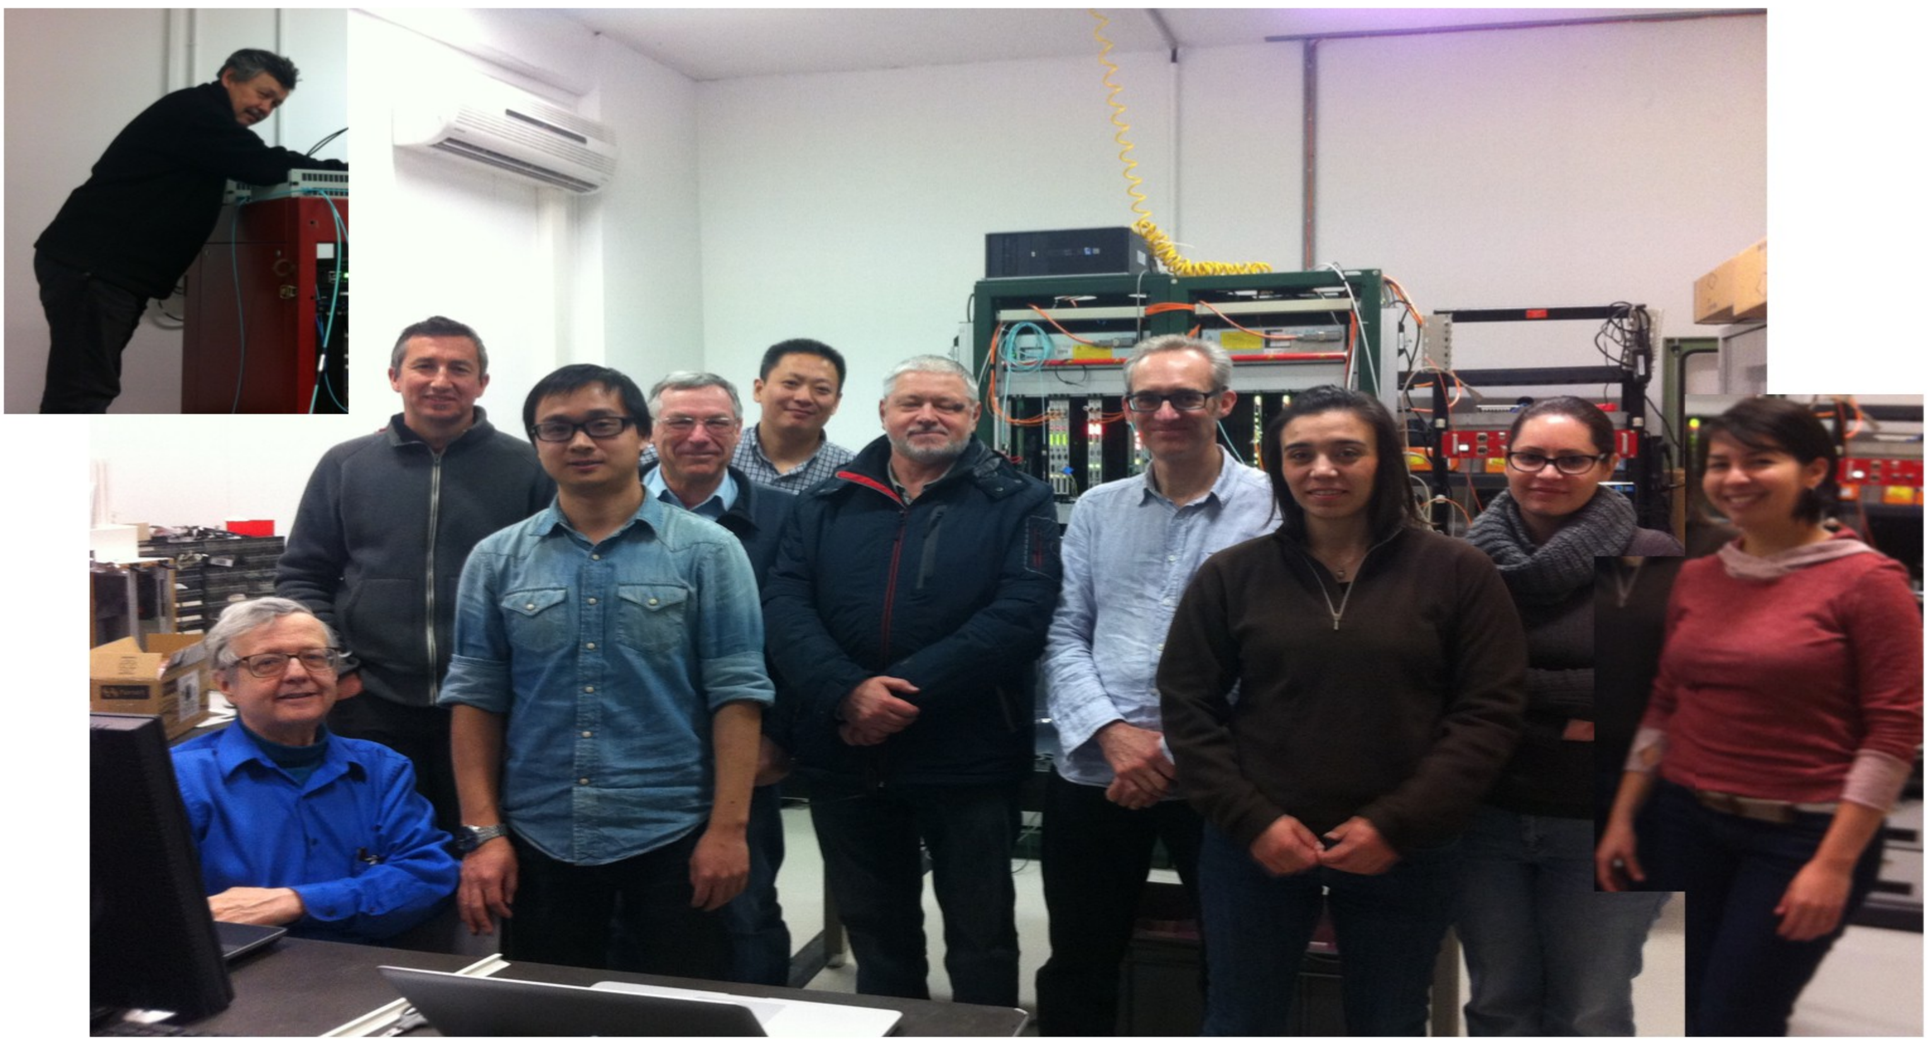




Global Feature EXtractor (gFEX)

Successful Link Speed Test @CERN

Unfortunately not all the people that worked hard in the project are in this picture (taken during LAr-gFEX test)



Summarizing

- Search for **heavy resonances** is **one of the most direct ways to find new physics** at TeV scale

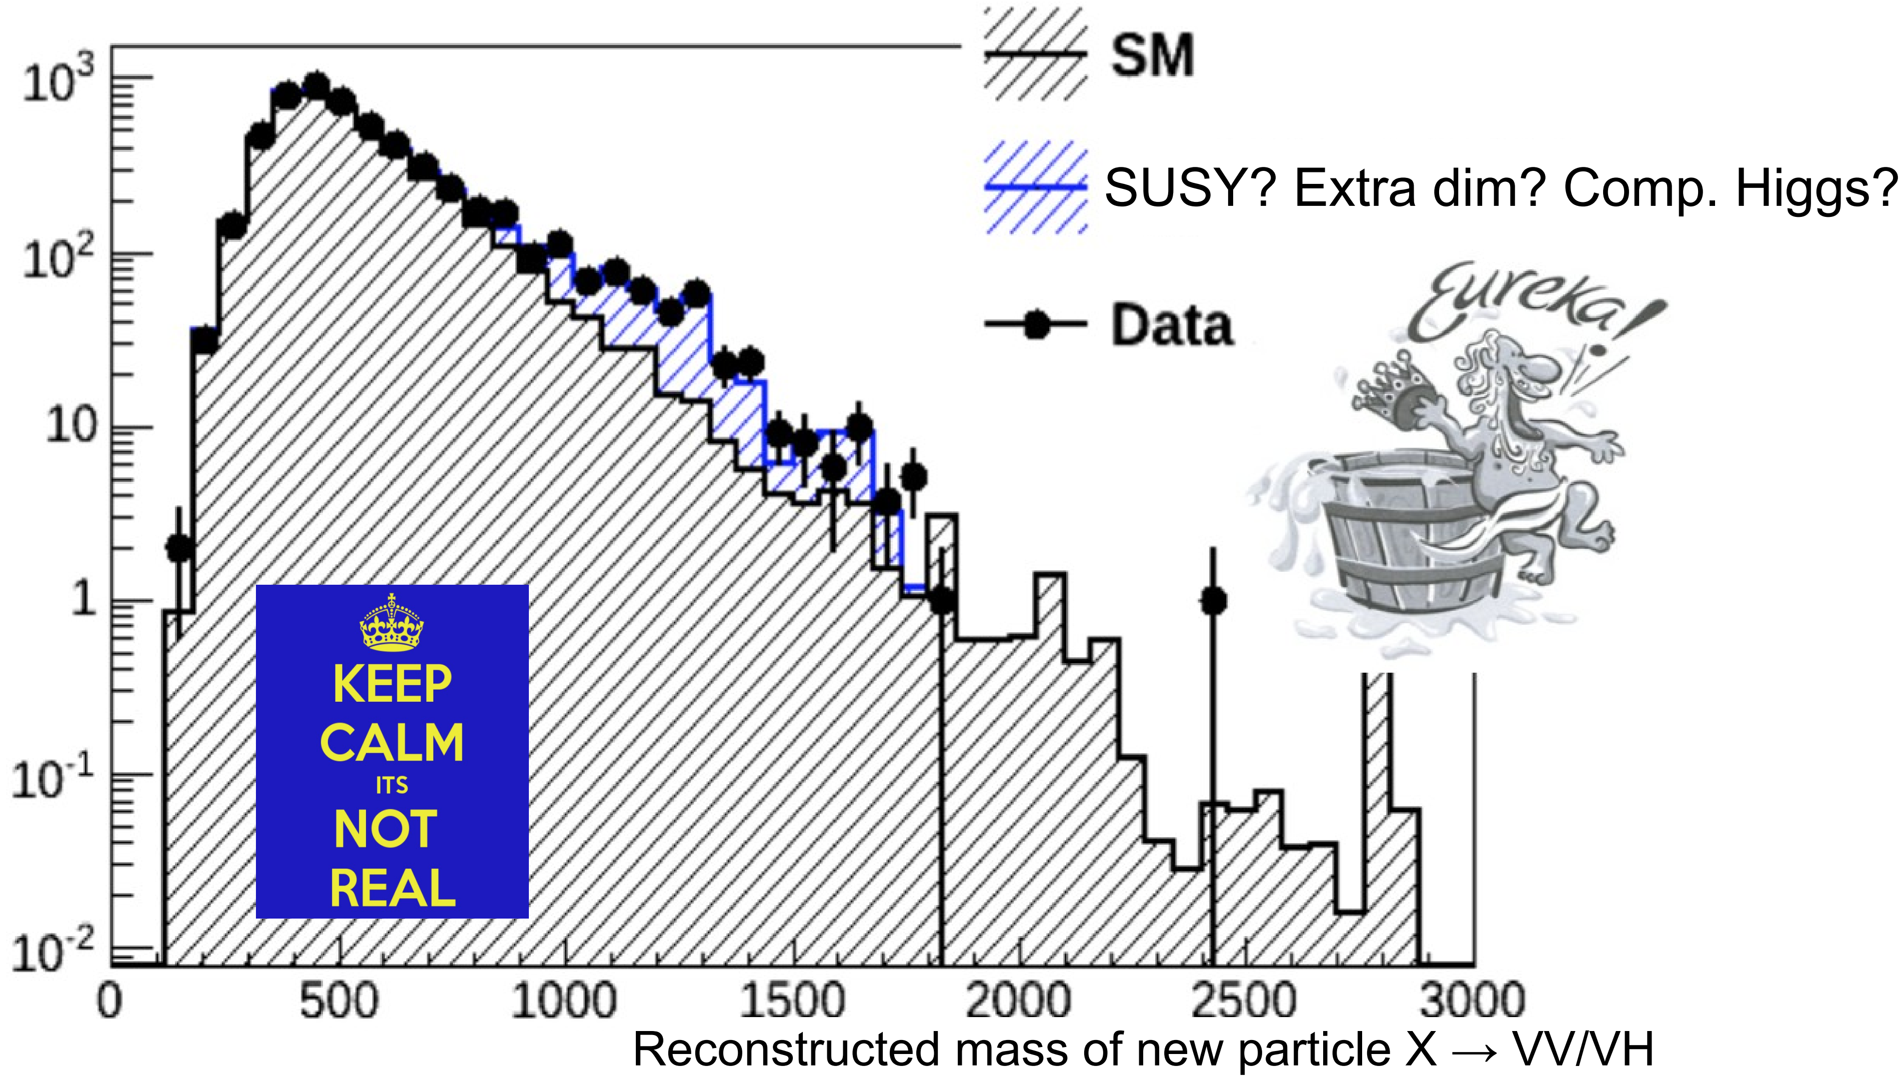
- Many Run-2 searches are now using these boosted techniques and many more are coming. **Wealth of physics encoded inside jets!**
  - Exploration of **higher mass scales** → JSS more and more important
  - Combine tracker and calorimeter information
  - Trigger level analysis could allow to explore the **low mass regions**?
  - The instantaneous luminosity increase represents a challenge for these analyses

- **No significant excess** observed so far but **lots of data is arriving now**!

- Thinking ahead: gFEX will increase trigger rejection to present acceptance in Run-3

Thanks for your attention!

Will diboson final states show us new physics in Run-2?



BACKUP

ATLAS improvements in Run-2

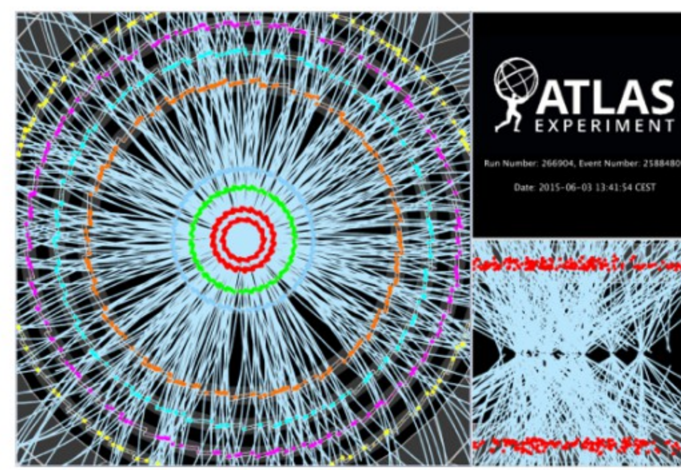
- **Insertable b-layer (IBL)** in place
- Upcoming trigger improvements:
  - **Fast TracK trigger (FTK)**
  - L1 topological trigger
- Software improvements:
  - New data format for analysis
  - Online (trigger) and offline jet reconstruction are ~the same

Insertable b-layer insertion (2014)

Trigger and data acquisition:

- First step: **fast hardware selection**
  - Run-1 data taking rate: 75 kHz
  - Run-2 data taking rate: 100 kHz
- Second step: **computer farm**
  - Run-1 data taking rate: 400 Hz
  - Run-2 data taking rate: 1000 Hz

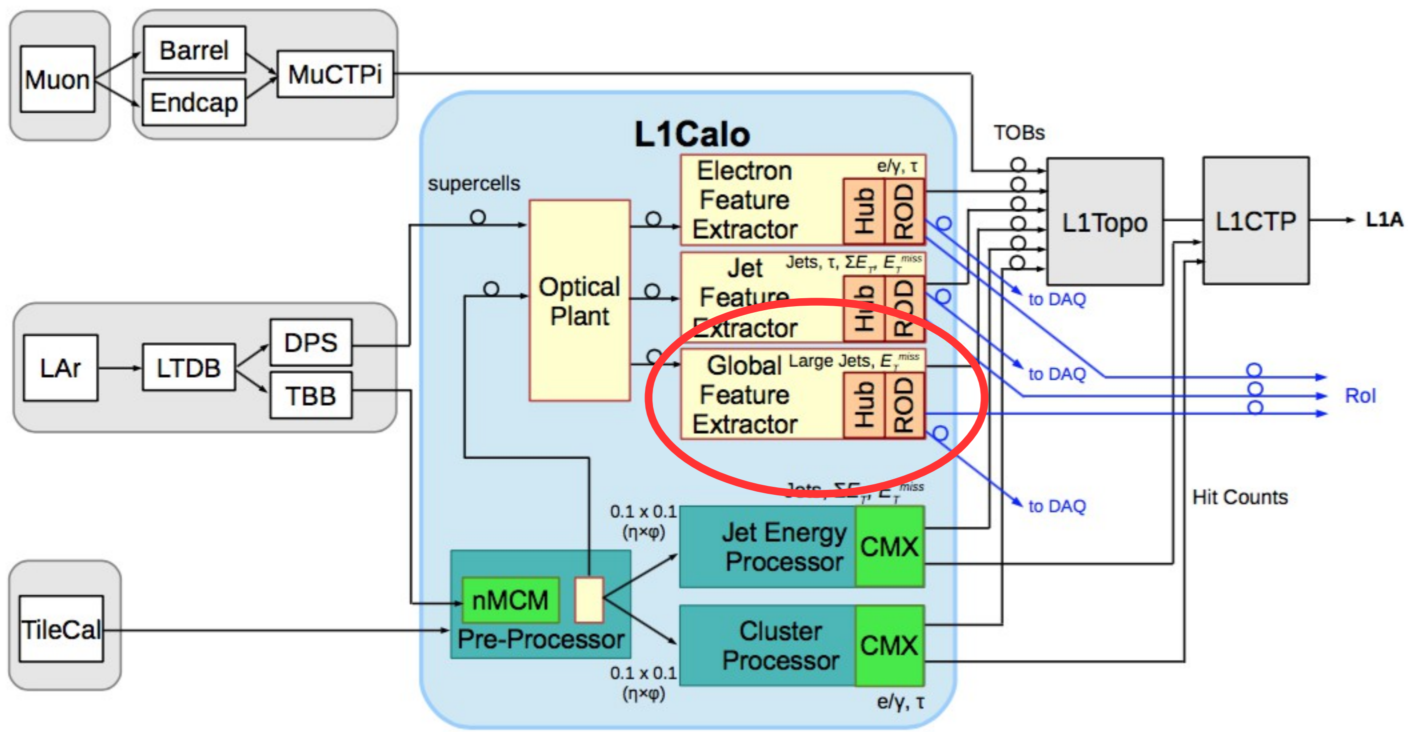
From C. Doglioni



IBL takes first proton-proton data

global Feature Extraction (gFEX)
The big picture

A new level 1 calorimeter trigger system for Run 3 (~2020)



- Entire **calorimeter in one single board**:
  - Jet substructure in Run 3 and beyond: fat jet reconstruction and jet-level pile-up corrections
  - Global event variables, e.g: E_T^{miss} and centrality

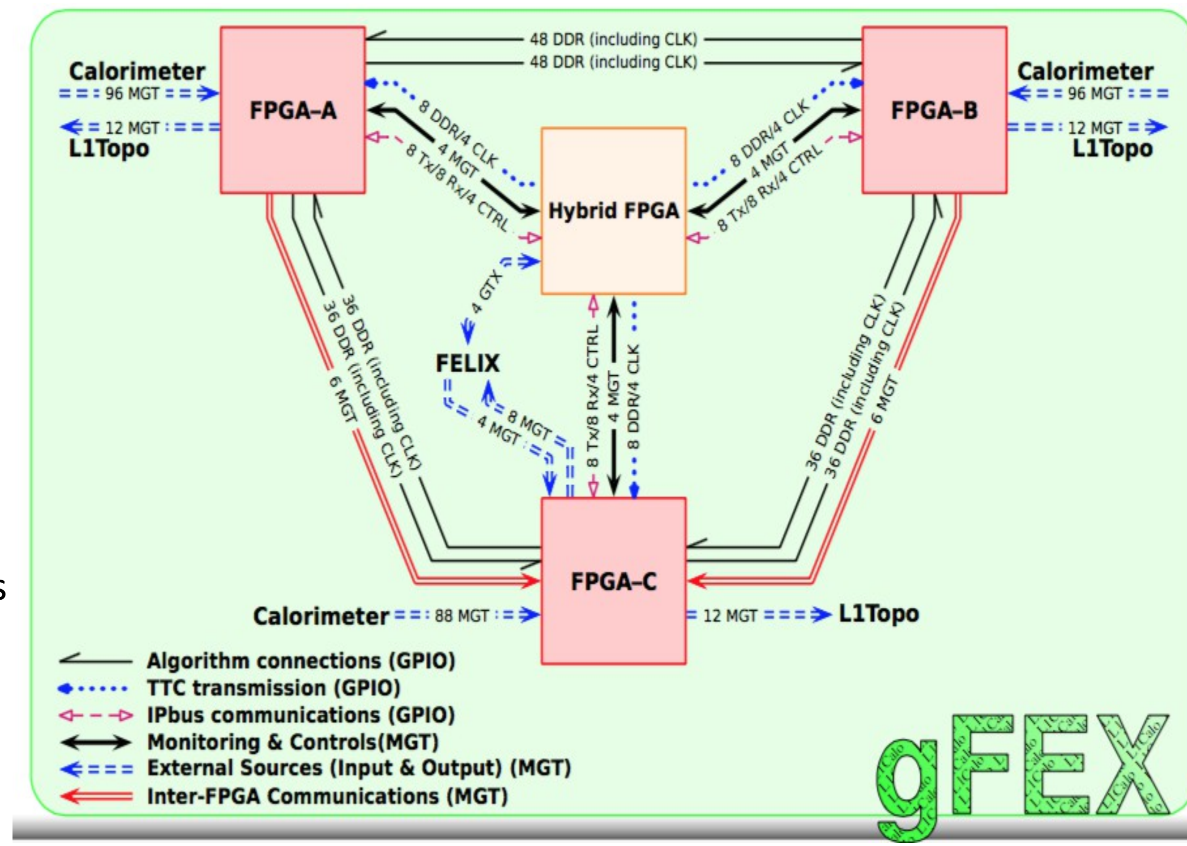
- Physics algorithms run within 5 bunch crossings (125 ns), not including data input/output

More on algorithms in Walter's talk!

global Feature Extraction (gFEX)
The big picture

A new level 1 calorimeter trigger system for Run 3 (~2020)

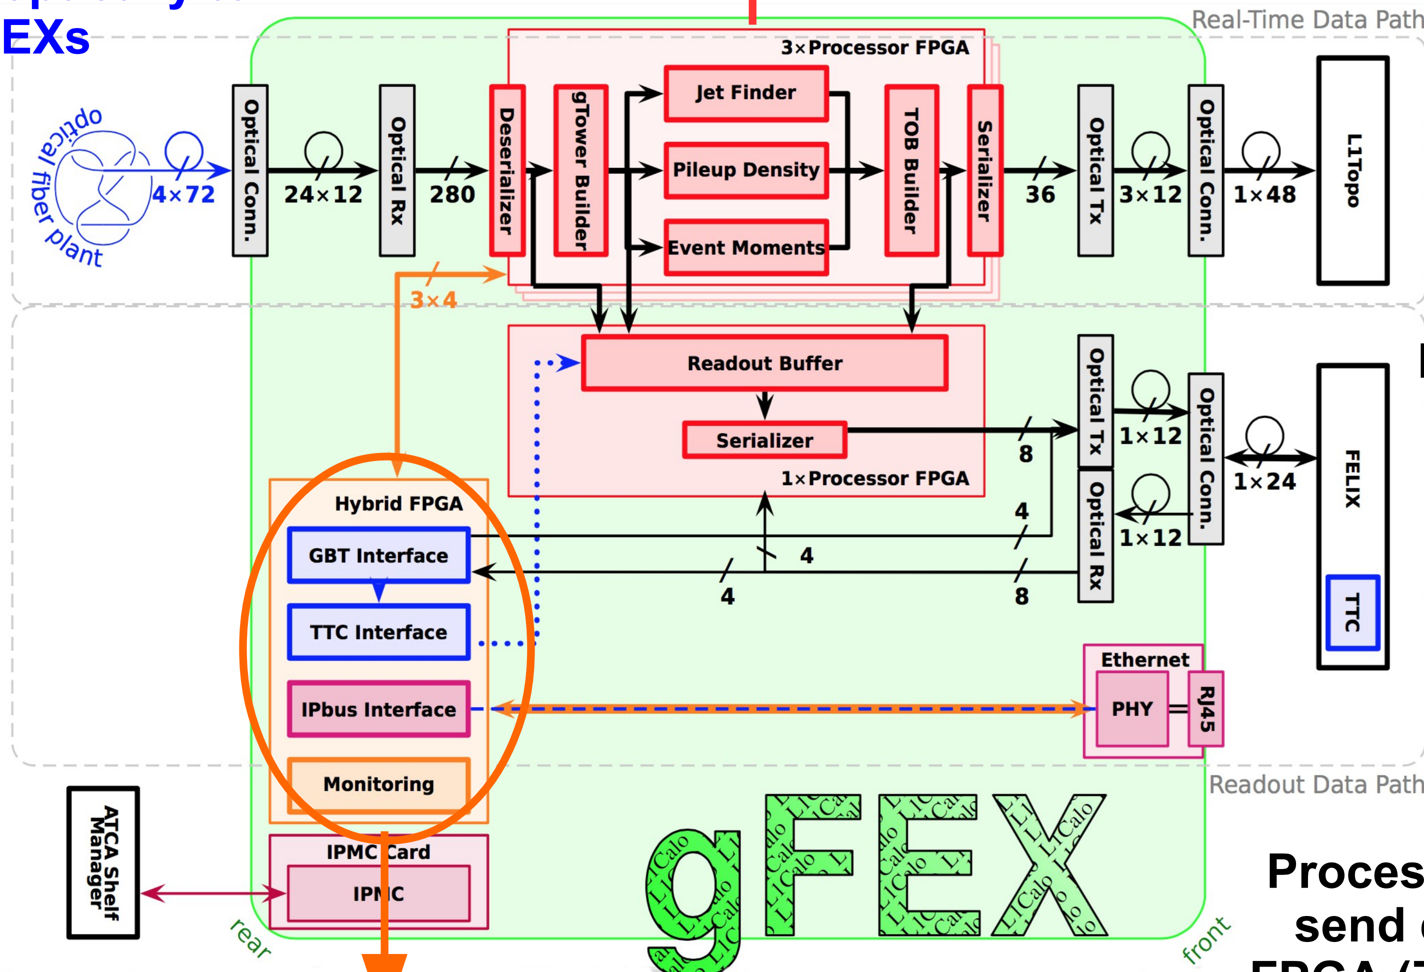
- One single module with several FPGAs for data processing
    - Inter-communication to avoid environments
- Hybrid FPGA (FPGA+CPU system-on-ship or Zynq) for control and monitoring
    - Process the event data from processor FPGAs
    - Algorithms to quickly detect calorimeter issues
    - Emulate the feature identification algorithms
    - Histograms interesting quantities



Zynq in gFEX

Data processing: algorithms run on FPGAs

Digitized signals transmitted optically to the FEXs



Data on the prototype can be transmitted via FELIX

Zynq provides configuration, slow control, monitoring and playback for gFEX

Processor FPGAs can send data to Hybrid FPGA (Zynq) for further analysis upon request or predefined error condition

Zynq functionality/features in gFEX
Control and monitoring

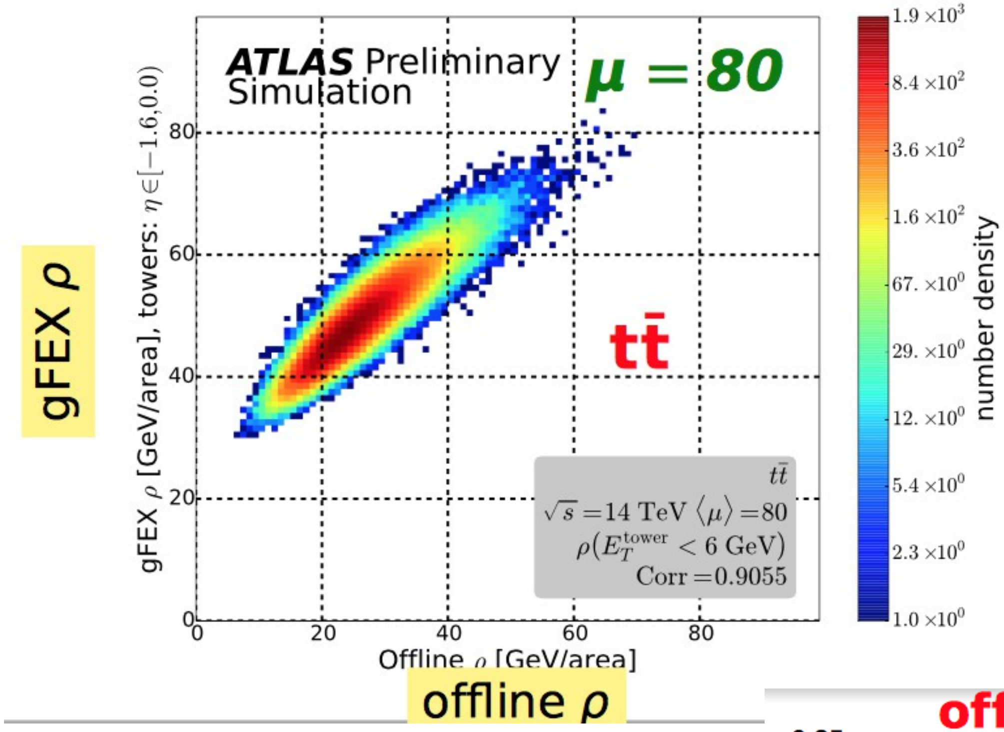
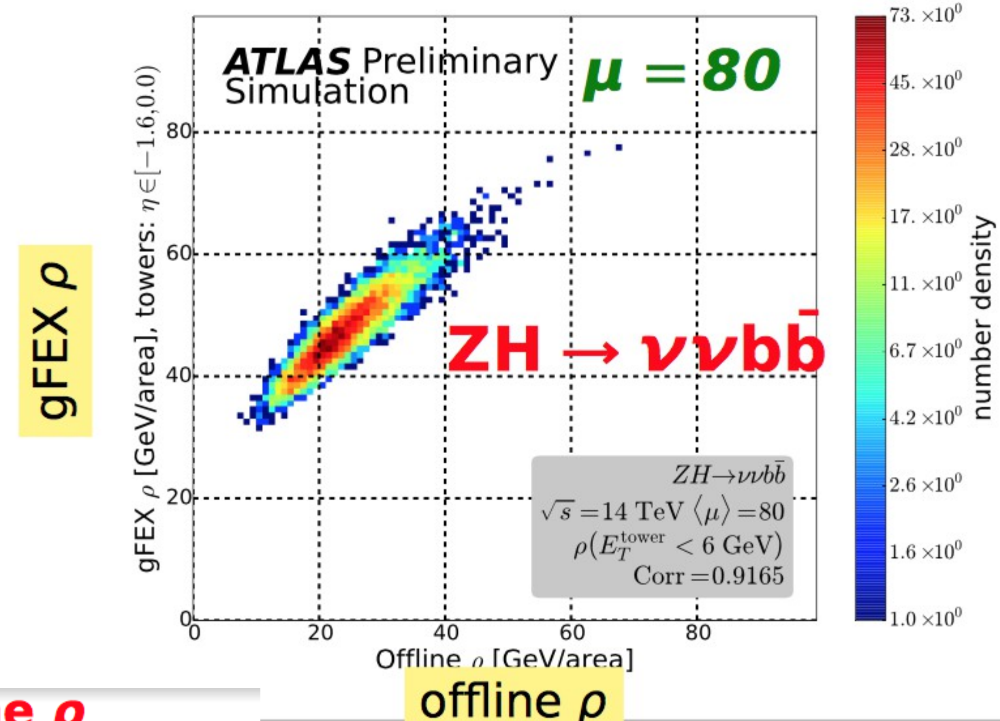
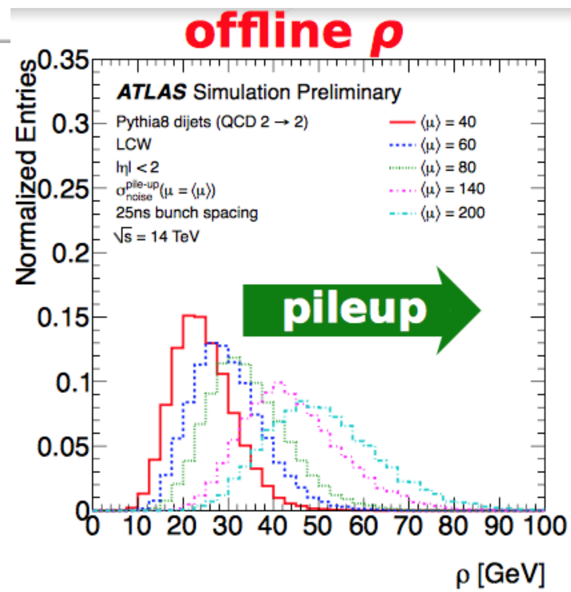
Disclaimer: GPIO and MGT counts out of date

gFEX: area based PU subtraction

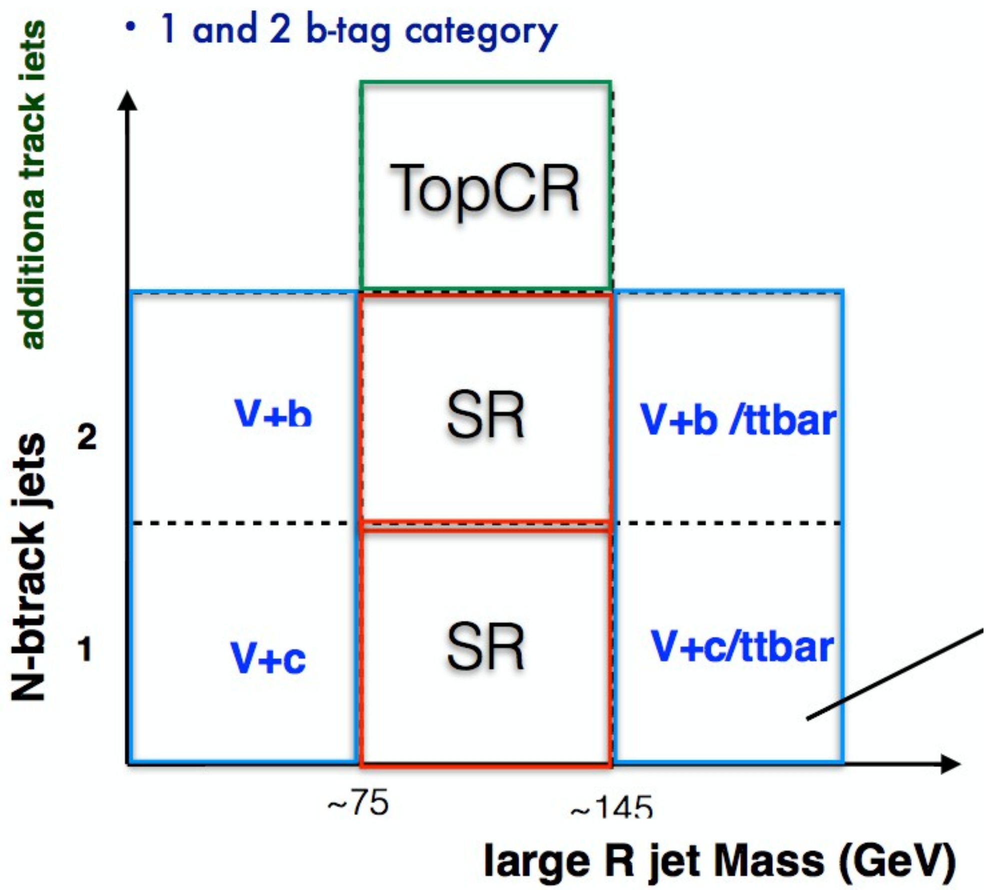






gFEX ρ = measure truncated mean (towers with E_T < 6 GeV) separately on each FPGA

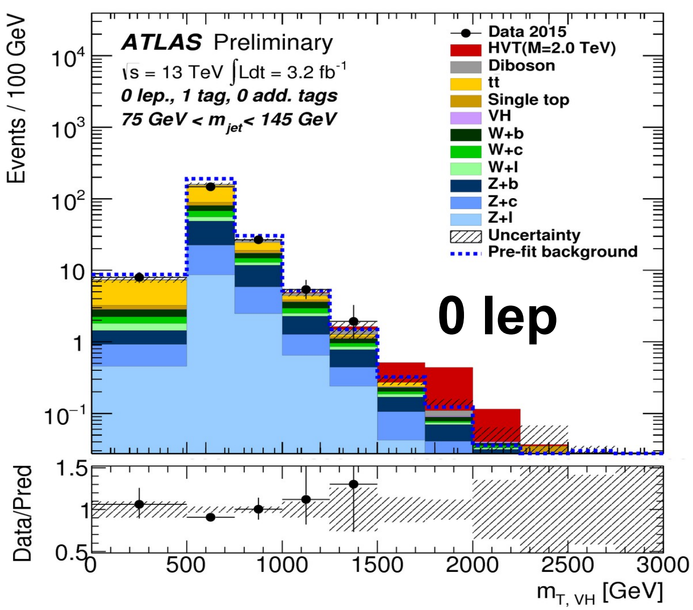
VH → llbb/lvbb/vvbb: backgrounds

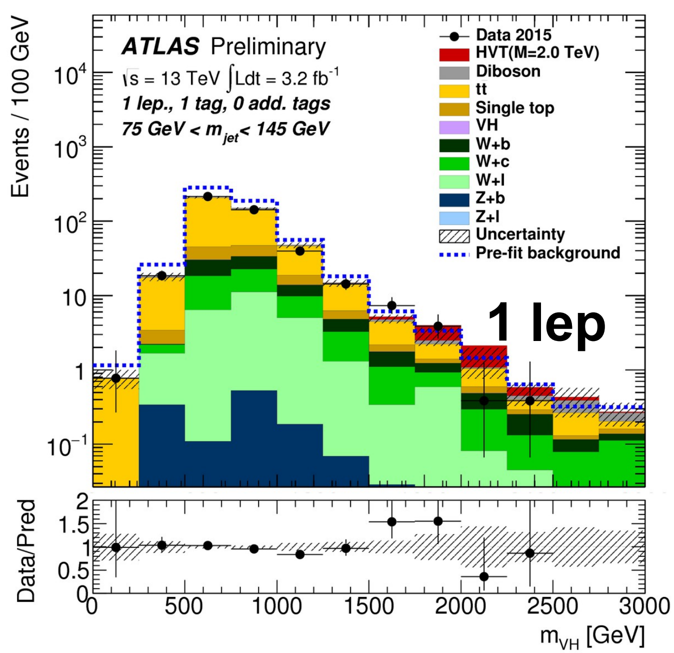


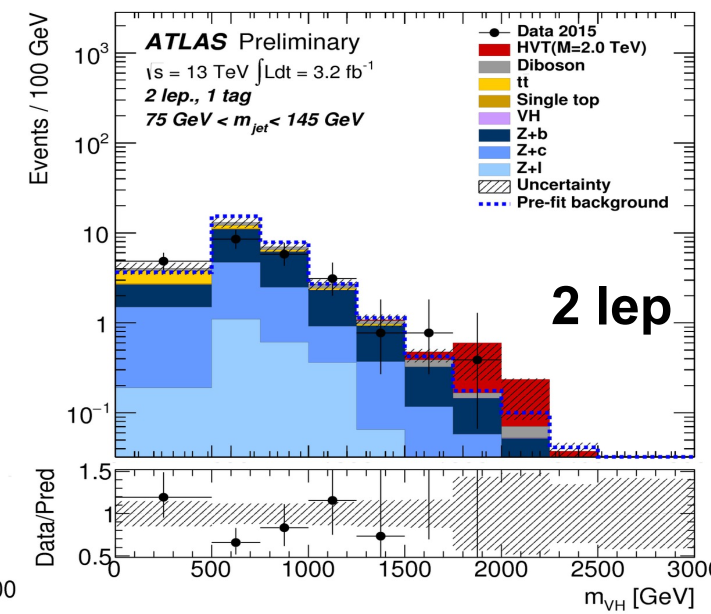
VH → llbb/lνbb/ννbb: Signal regions

- Use m_{VH} ($m_{T,VH}$ for the ννbb channel) as a discriminant
- No excess over the SM background
- Limits set on HVT models

1 b-tag

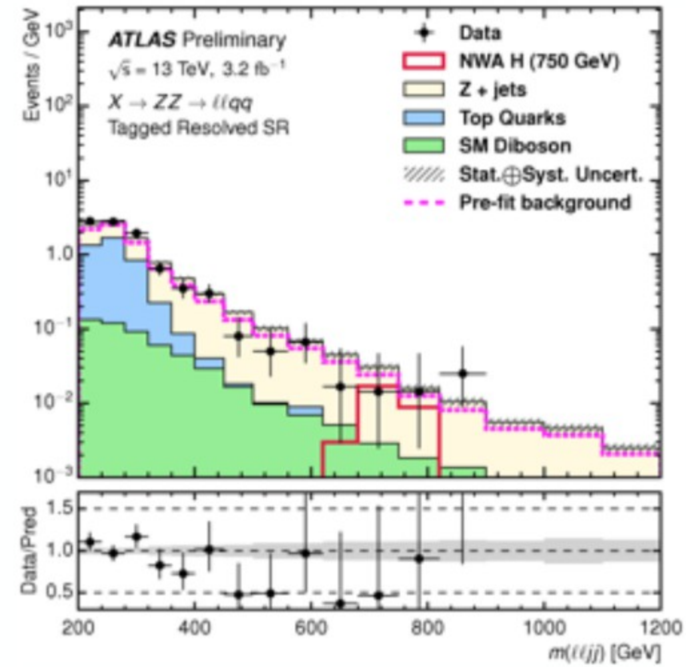


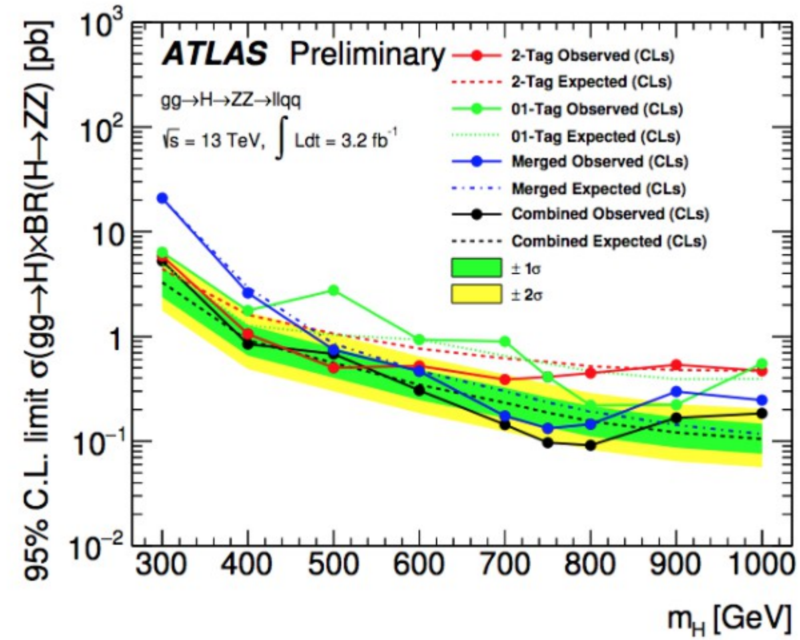




ATLAS results for ZZ → llqq

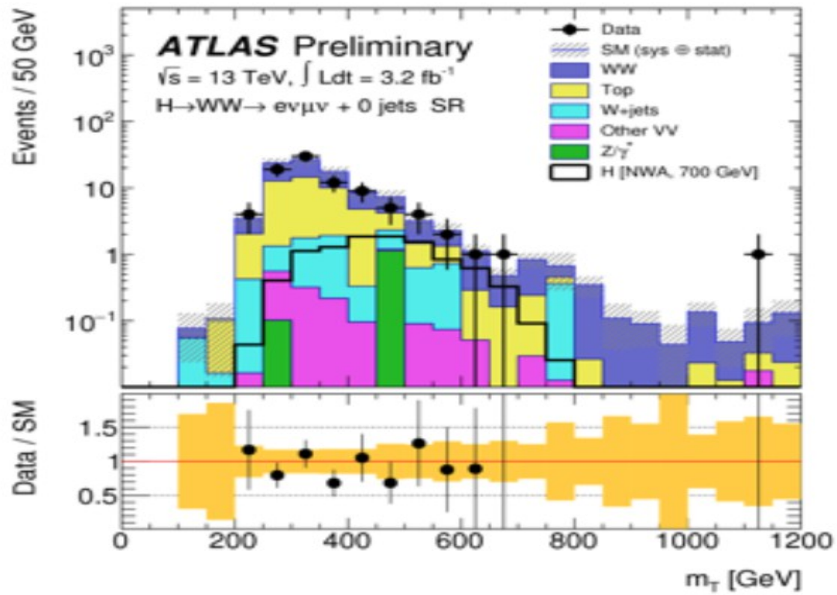
- Enhance the sensitivity at 750 GeV using resolved selection for ZZ ẁ llqq
- Resolved topology: 2 narrow (anti-kT R= 0.4) jets are used to reconstruct the hadronically-decaying bosons, e.g. Zẁ qq
- Add b-tag categories to exploit Z ẁ bb
- Overall strategy: apply boosted selection first, then “recycle” events with the resolved, giving priority to the signal regions



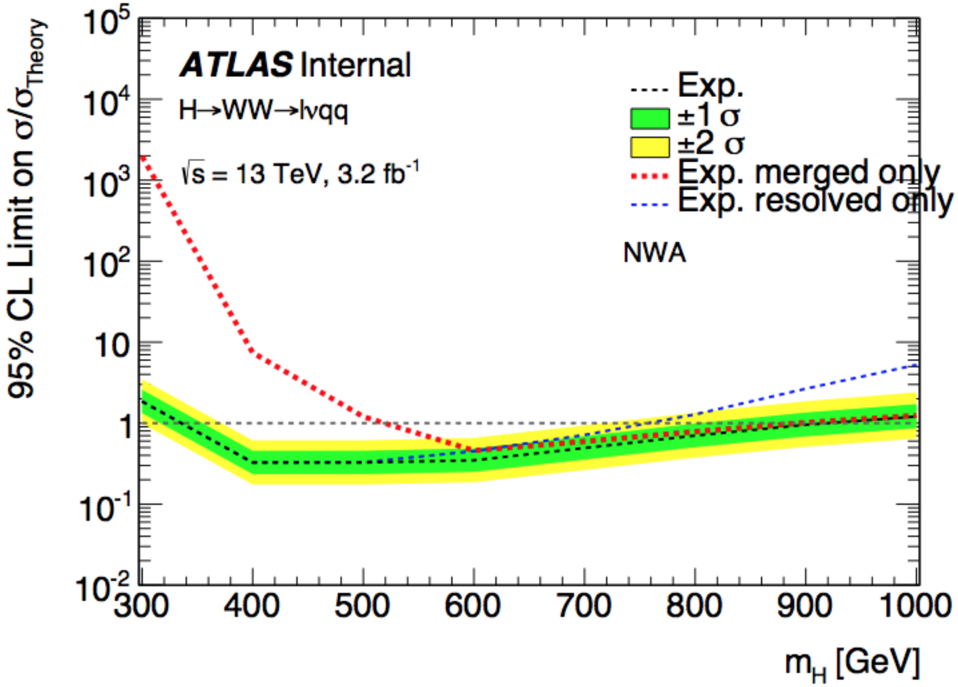


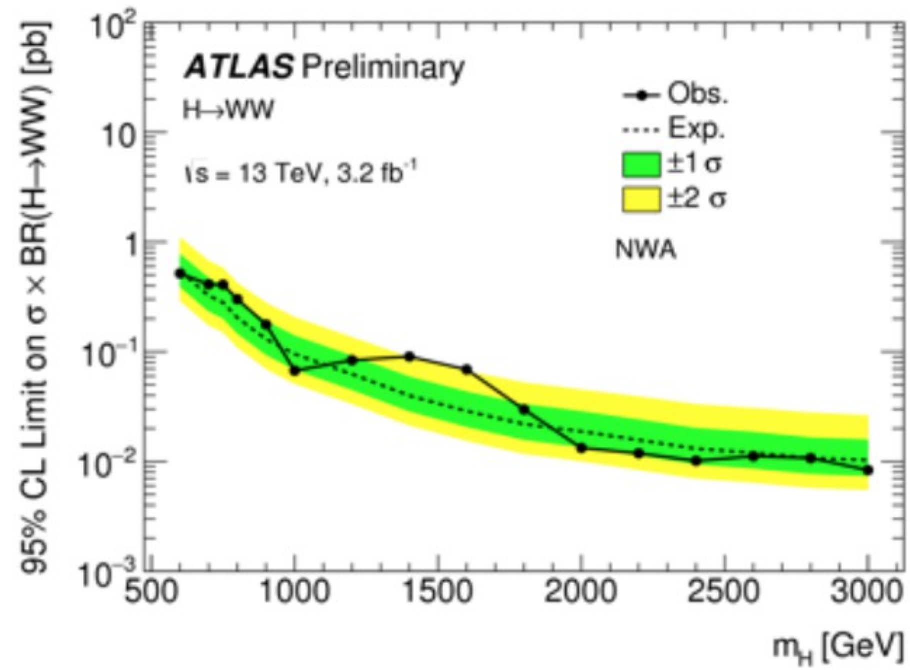
ATLAS-CONF-2016-016

ATLAS results for WW → lvlv/lvqq

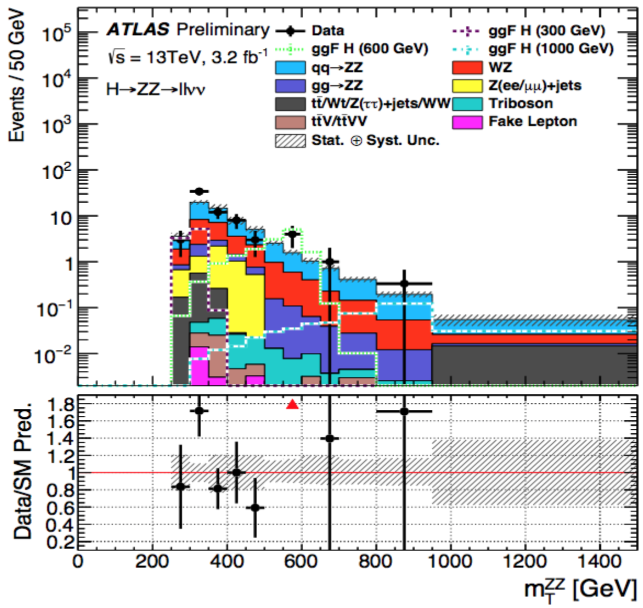


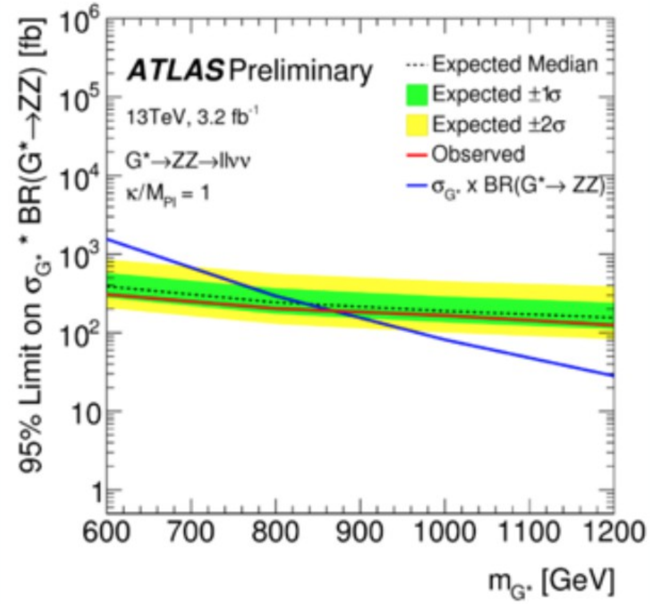
lvlv+lvqq CONF for Moriond with boosted+leptonic (ATLAS-CONF-2016-021)



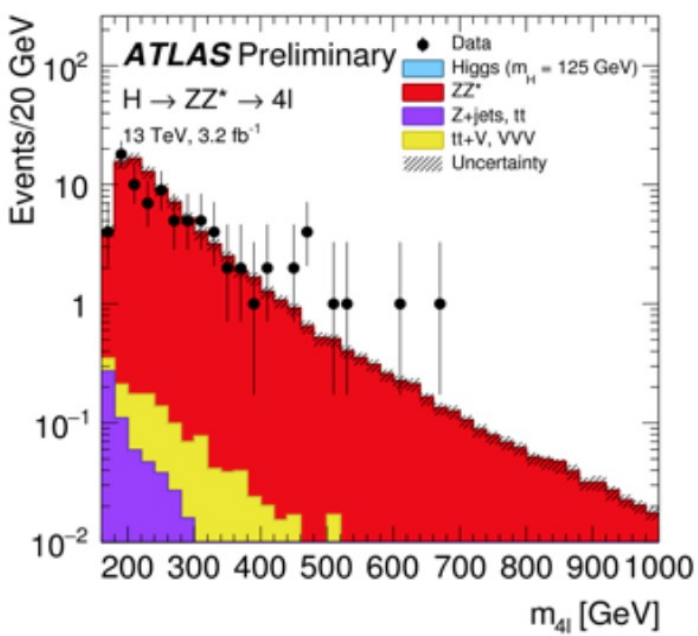


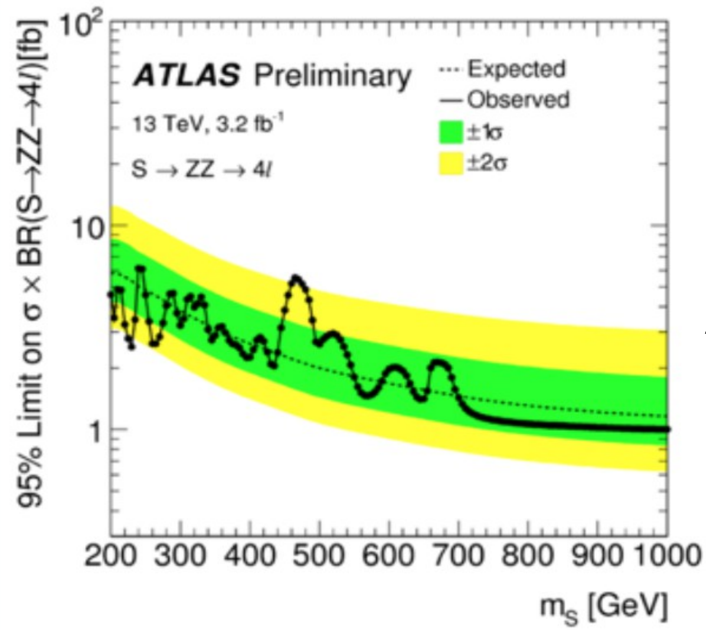
ZZ → llll and llvv





Z ẁ llvv
ATLAS-CONF-2016-012



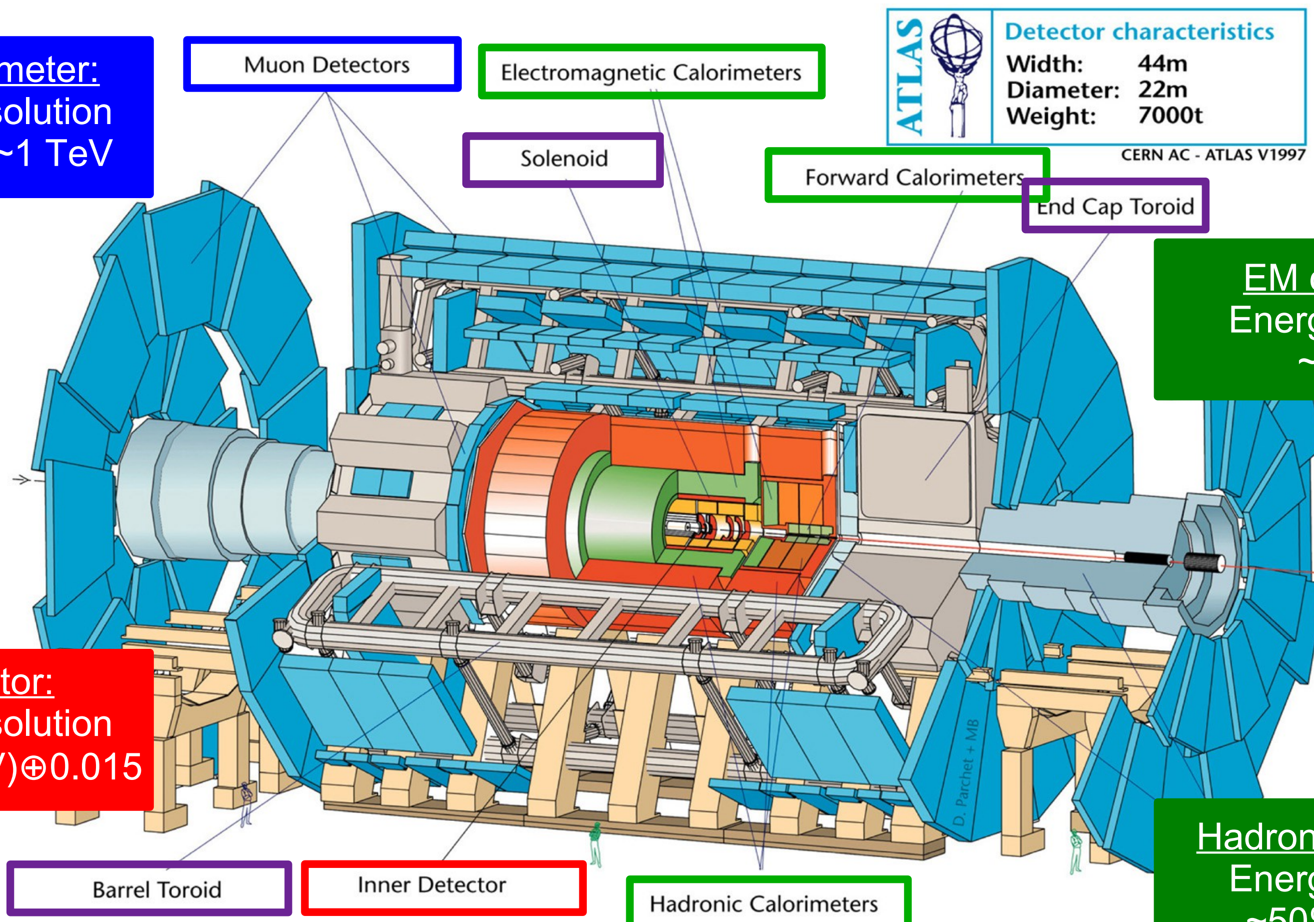


Z ẁ llll
ATLAS-CONF-2015-059

ATLAS (A Toroidal LHC ApparatuS)

- ATLAS consists of a series of concentric sub-detectors around the interaction point
- Divided into 4 major parts: **the inner detector, the calorimeters, the muon spectrometer and the magnet systems**

<u>Muon spectrometer:</u>
Momentum resolution
<10% up to E_{μ}~1 TeV



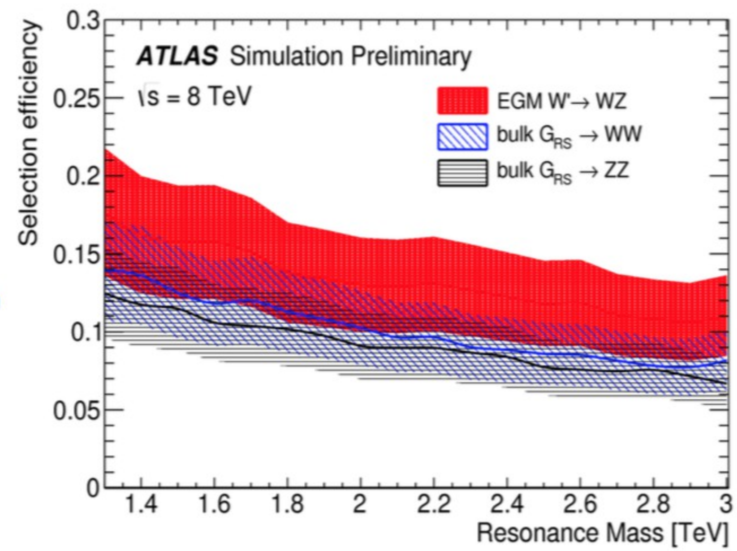
<u>EM calorimeter:</u>
Energy resolution
~10%/√E

<u>Inner detector:</u>
Momentum resolution
~$3.8\times10^{-4}\, p_T(\mathrm{GeV}) \oplus 0.015$

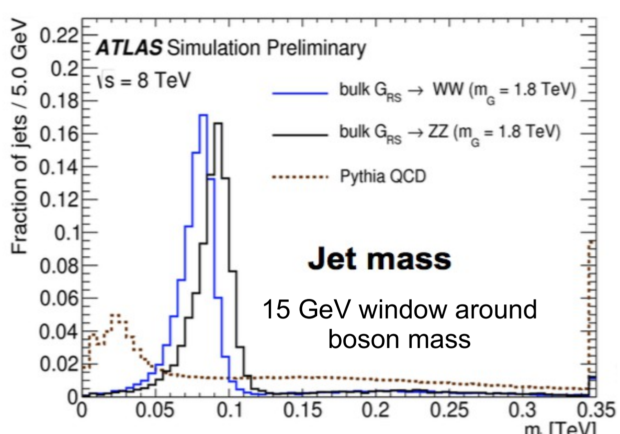
<u>Hadronic calorimeter:</u>
Energy resolution
~50%/√E⊕0.03

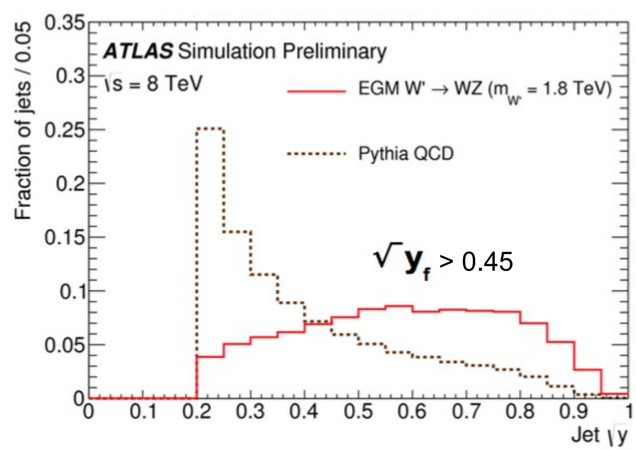
Search for new diboson resonances in ATLAS: Run-1 Event selection

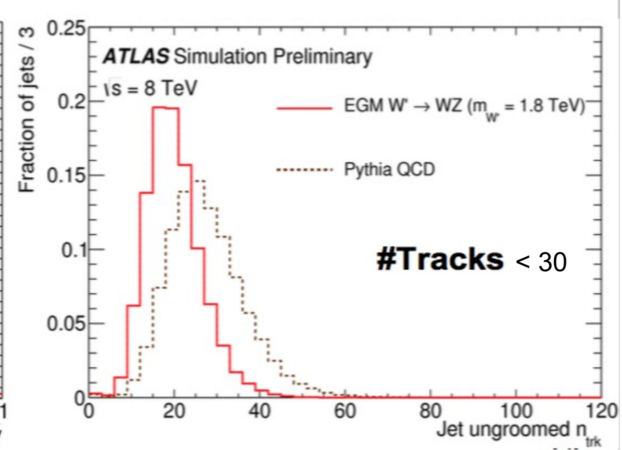
1. **Trigger selection:** EF_j360_a10tcem (lowest unprescaled jet trigger for 2012)
2. **Quality:**
   - GRL
   - DQ checks from data preparation: coreFlags, LArError, TileError, TileTripReader
   - Bad/ugly jets
   - BCH_CORR_CELL cleaning
3. **Lepton/MET veto:** orthogonal with other diboson searches
4. **Jets:**
   - **2 jets filtered with BDRS-A**
   - **Mass of dijet-system** is required to be **above 1.05 TeV**[1], in order to avoid region with trigger inefficiency
   - **Rapidity gap between the two leading jets** $|\Delta y_{12}| < 1.2$, to reject QCD t-channel dijet production
   - p_T **asymmetry,** $A < 0.15$, between two leading jets, to select balanced events
   - $|\eta < 2.0|$ to ensure good overlap with the inner detector
   - **Boson tagging criteria applied**



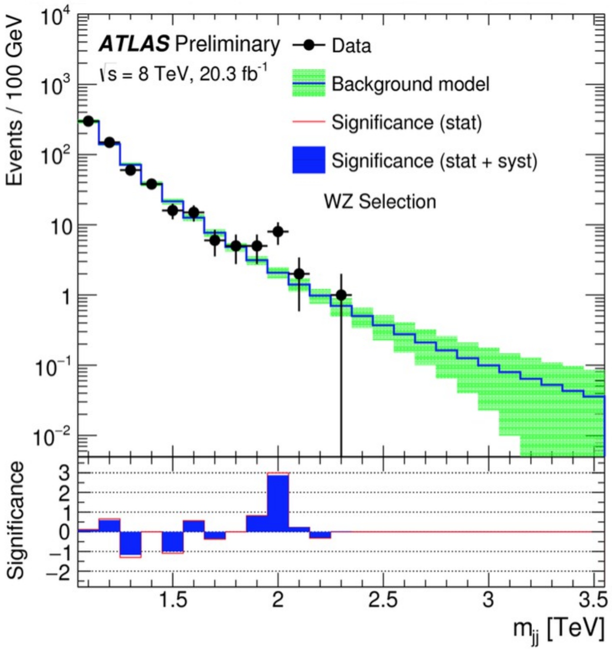
WW, WZ, ZZ partially overlapping selections

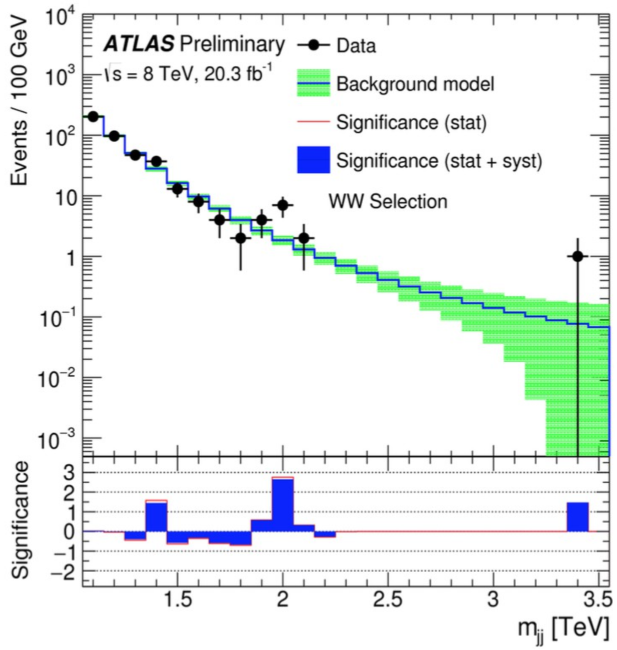


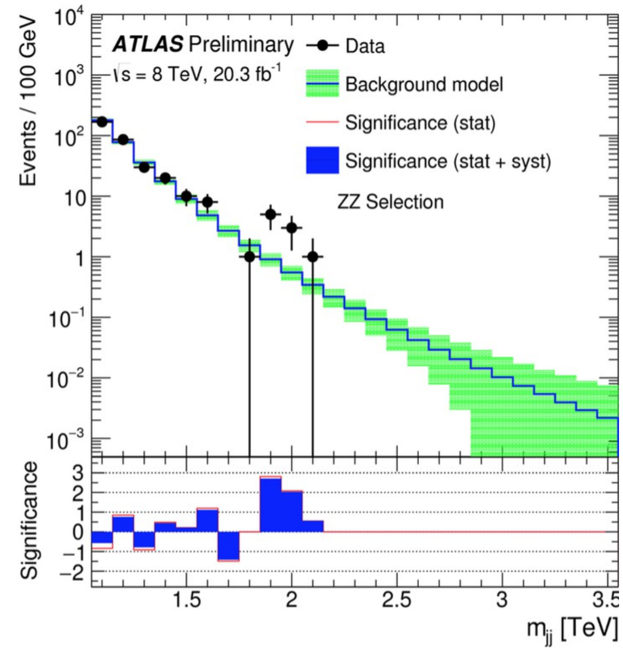


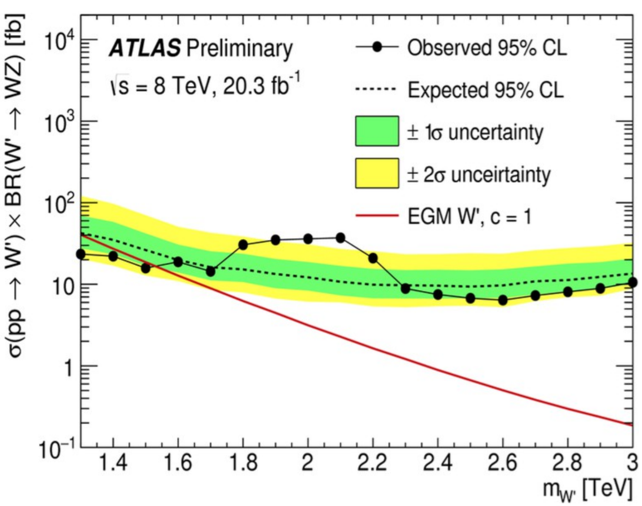


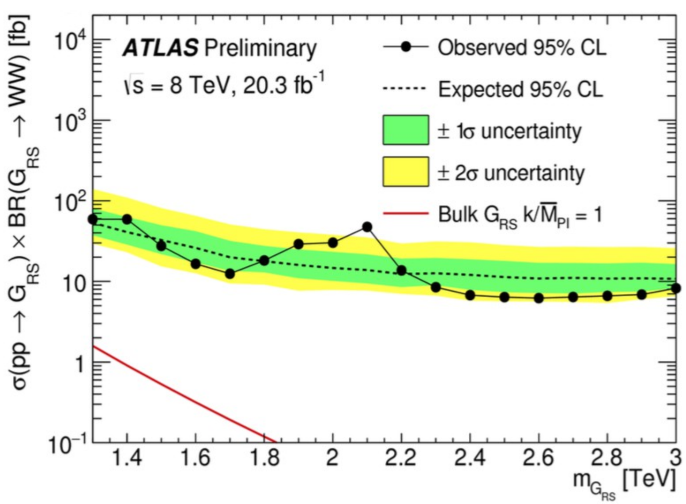
Full hadronic diboson Run-1 results

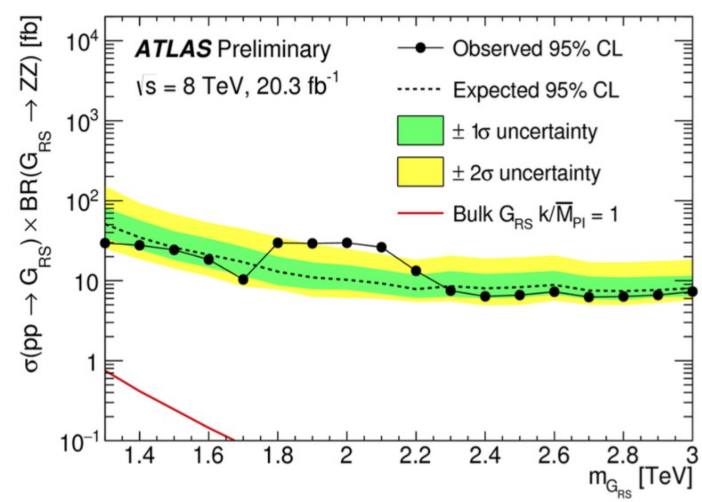




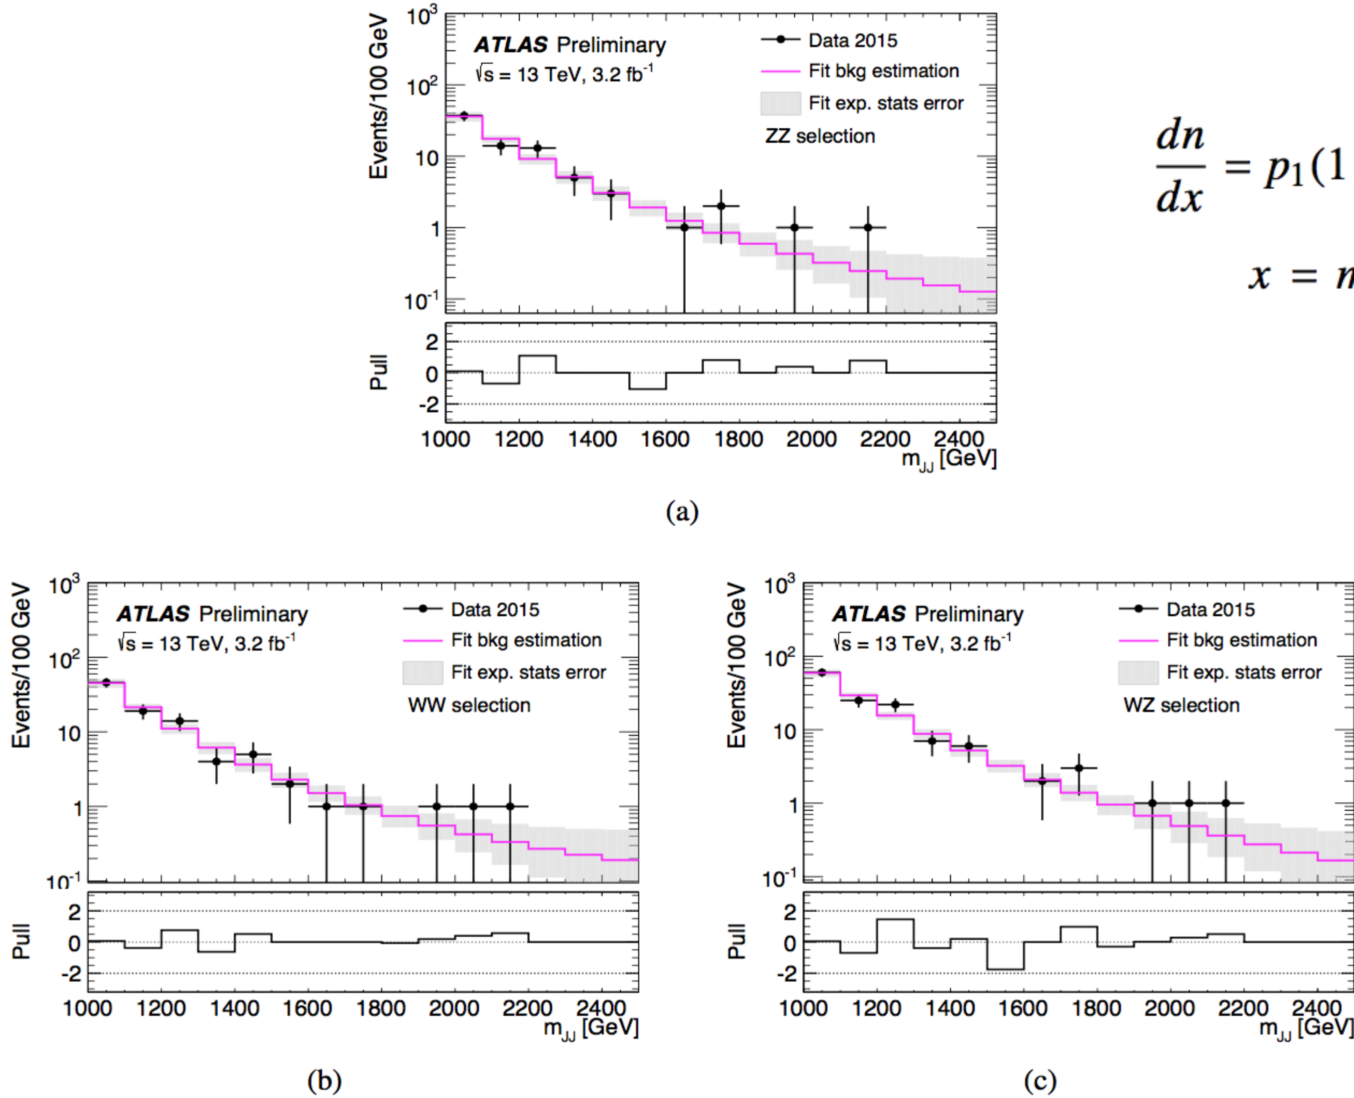








Full hadronic diboson Run-2 results



$$\frac{dn}{dx} = p_1(1-x)^{p_2+\xi p_3} x^{p_3}$$

$$x = m_{JJ}/\sqrt{s},$$

Figure 7: The observed data in the signal regions of the ZZ (a), WW (b) and WZ (c) channels. Also shown is the fitted background. The region in gray represents the uncertainty on the background estimate due to the fit. The event selection in the three regions overlap and approximately one fourth of the events appear in all three regions.

Full hadronic diboson Run-2 results

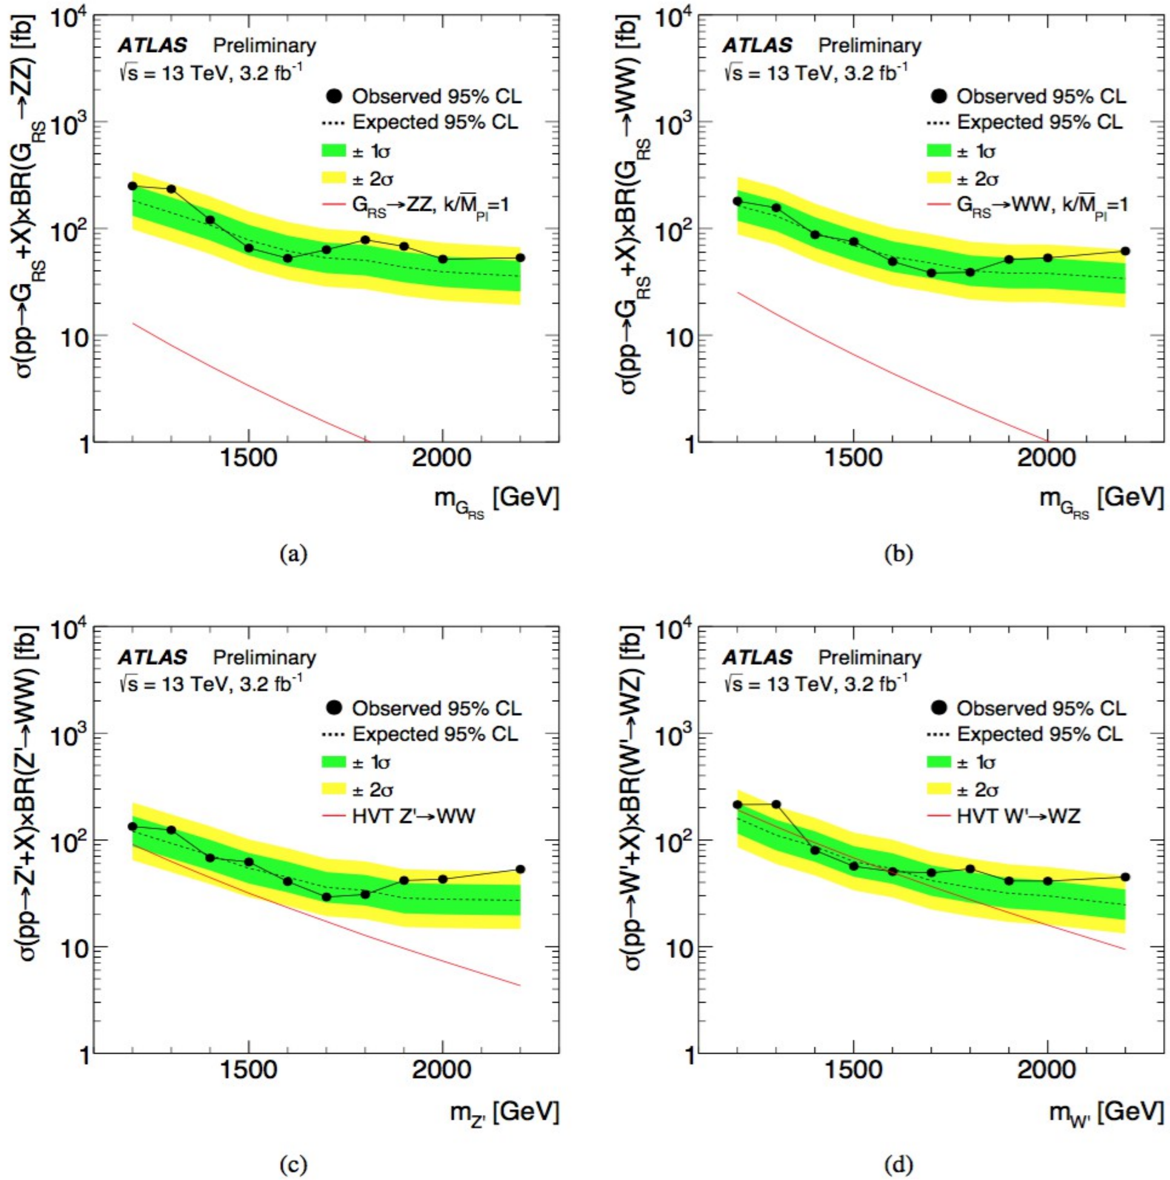


Figure 8: The limits set on the bulk RS graviton through (a) the ZZ and (b) the WW channels, and on the HVT through (c) the $Z' \to WW$ and (d) the $W' \to WZ$ analyses.
