Studies of Number of Hits/Lever Arm (Generation Level)

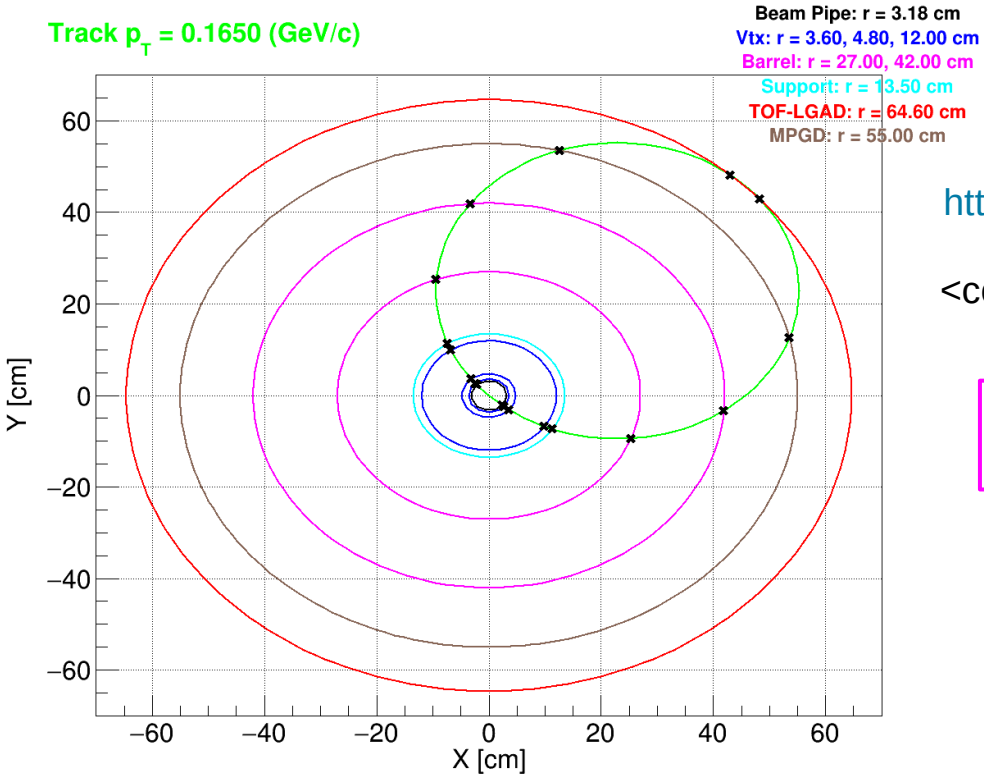
Shyam Kumar, Annalisa Mastroserio, Domenico Elia
INFN Bari, Italy

EPIC Configuration

epic_brycecanyon.xml with calorimeters and far forward detectors removed

Curling tracks

```
shyam@shyam:~/eic/epic$ git tag -l
22.10.0
22.10_rc1
22.11.0
shyam@shyam:~/eic/epic$ git checkout 22.10.0
shyam@shyam:~/eic/epic$ git pull origin main
```



https://github.com/eic/epic/blob/main/compact/definitions.xml

<constant name="Solenoid_rmin"value="1420.0*mm"/>

p_{Tmin} = 0.3*1.7*1.42/2 = 0.3621 GeV/c

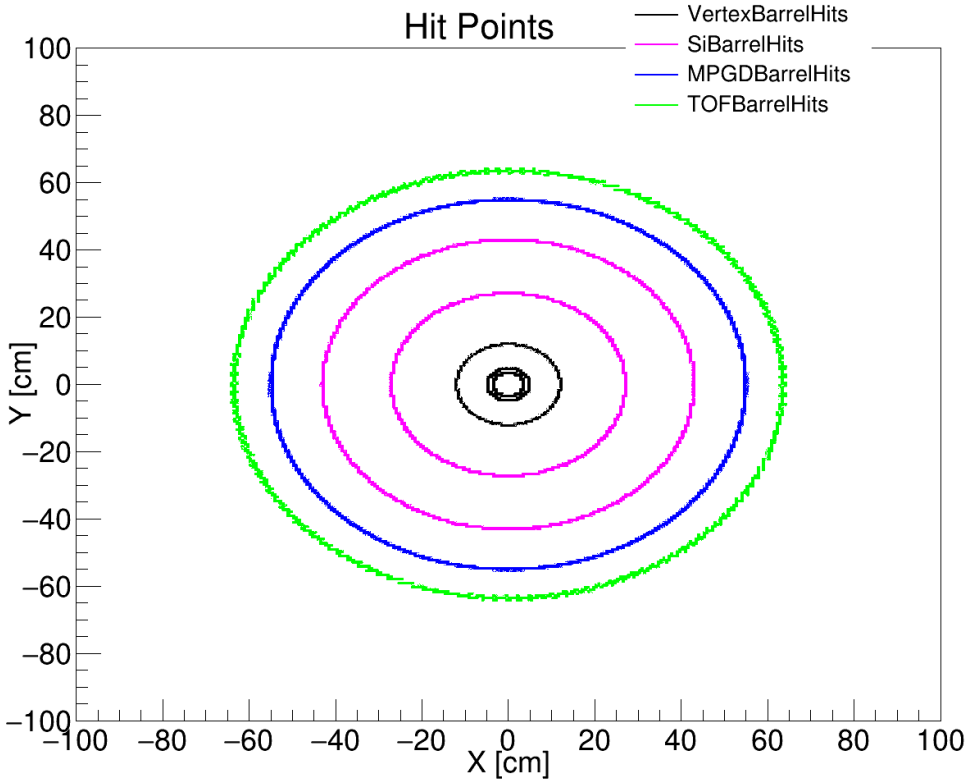
Barrel EMCal

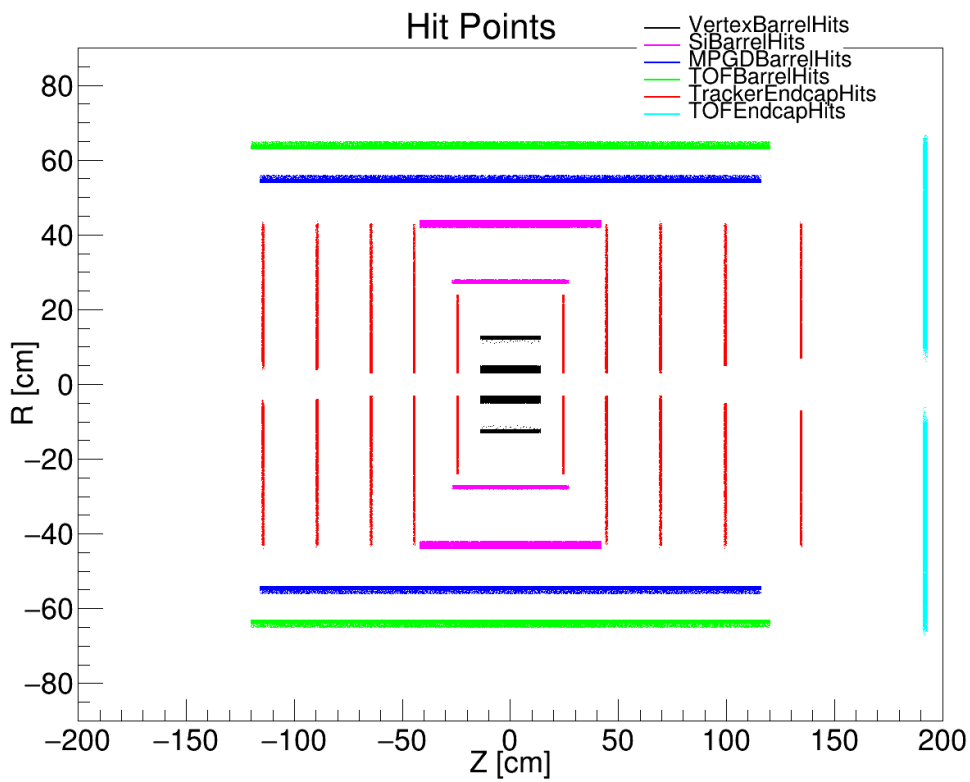
P_{Tmin} = 0.3*1.7*0.78/2 = 0.199 GeV/c

field_map="fieldmaps/MARCO_v.6.4.1.1.3_1.7T_Magnetic_Field_Map_2022_11_14_rad_coords_cm_T.txt"
url="https://github.com/eic/epic-data/raw/64b7ca6306b138b7f000e696c82bd8f72db1da56MARCO_v.6.4.1.1.3_1.7T_Magnetic_Field_Map_**2022_11_14_rad**_coords_cm_T.txt"

3M mu- in the momentum range [0.1,10.] GeV/c and η [-3.5,3.5]

ETOF hits included





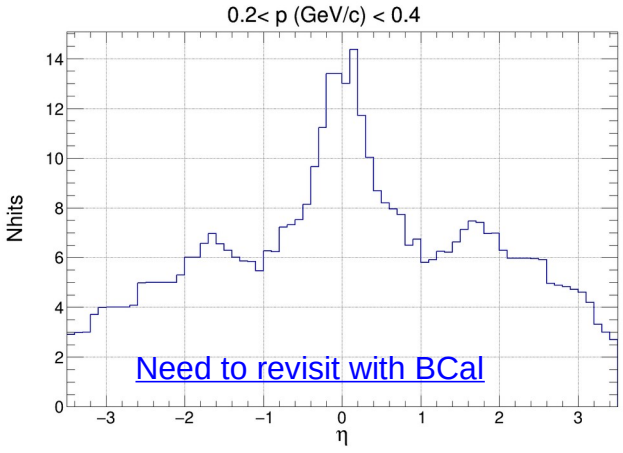
VertexBarrelHits.quality

quality = 0 for primary hits

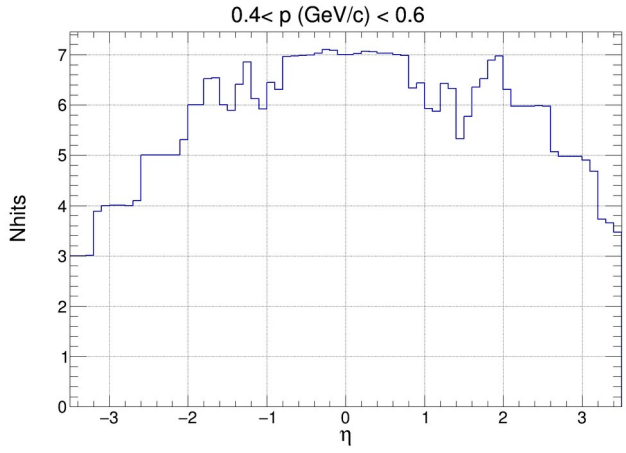
Secondary Hits removed using quality

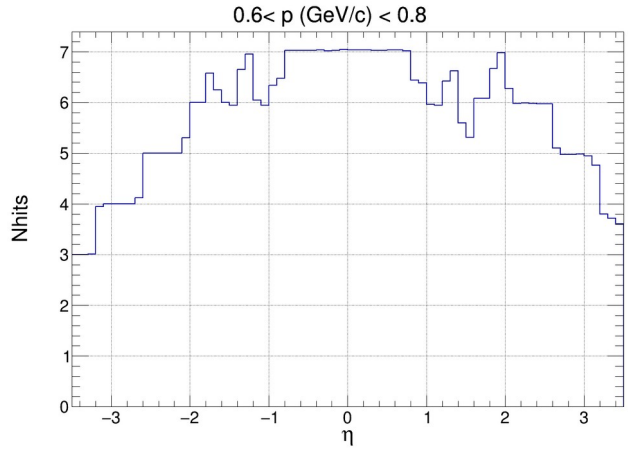
Nhits (Generation Level)

At larger η with ETOF average hits < 4

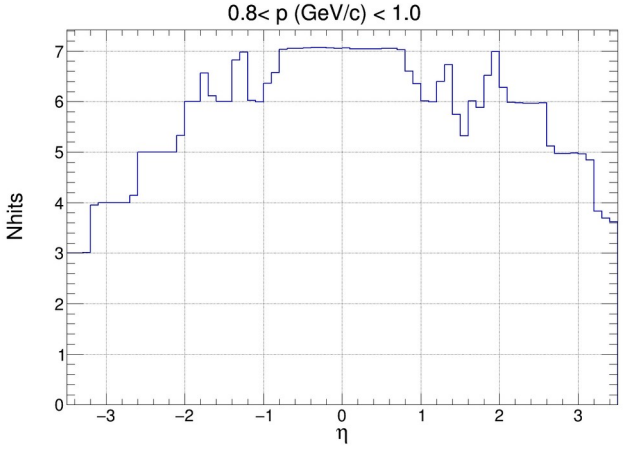


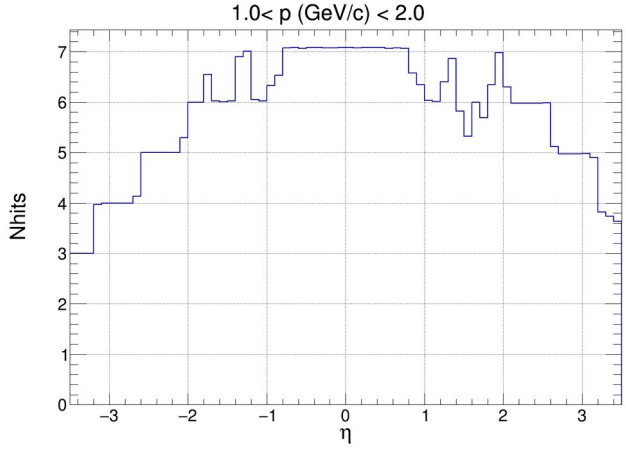
Need to revisit with BCal

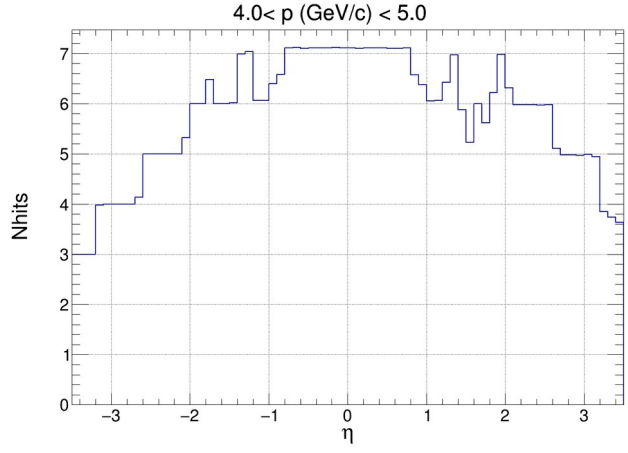




3 hit case may bias the results



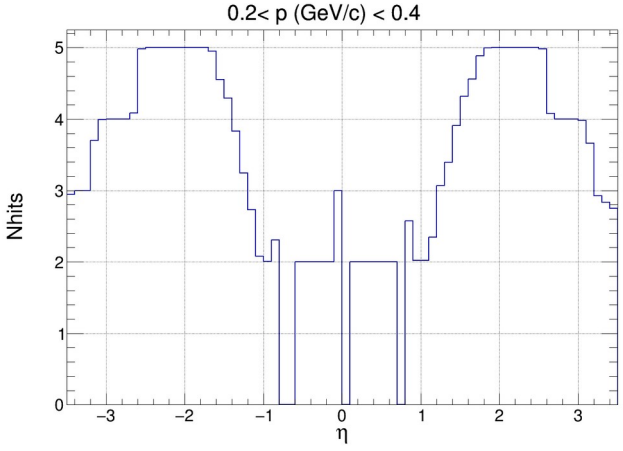


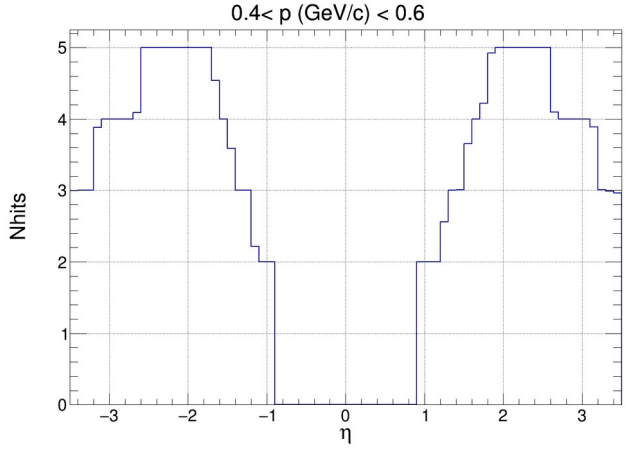


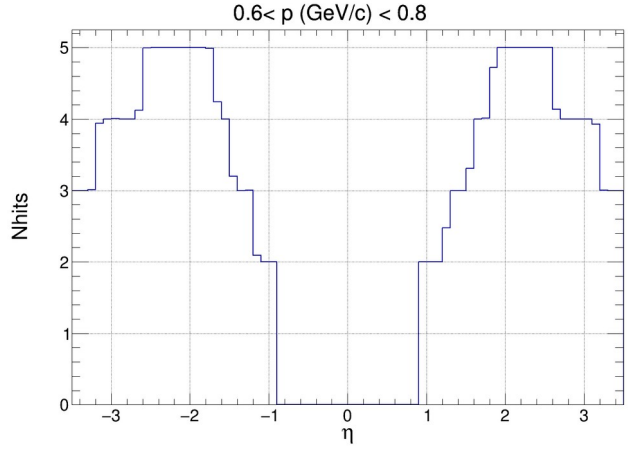
Nhits and Lever Arm for Disks (Generation Level)

Positive eta DiskZ: [25,45,70,100,135]

Negative eta DiskZ: [-25,-45,-65,-90,-115]

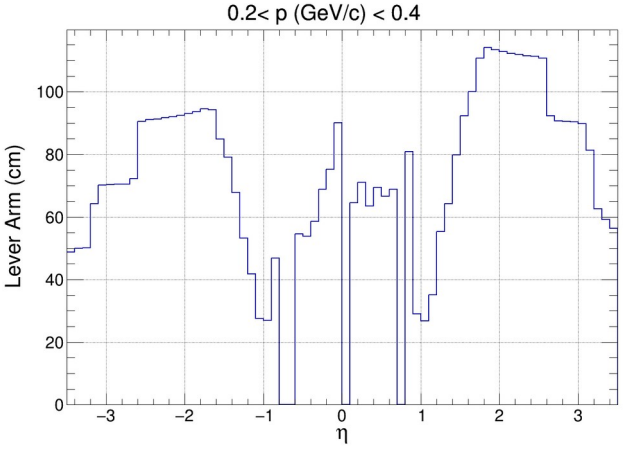


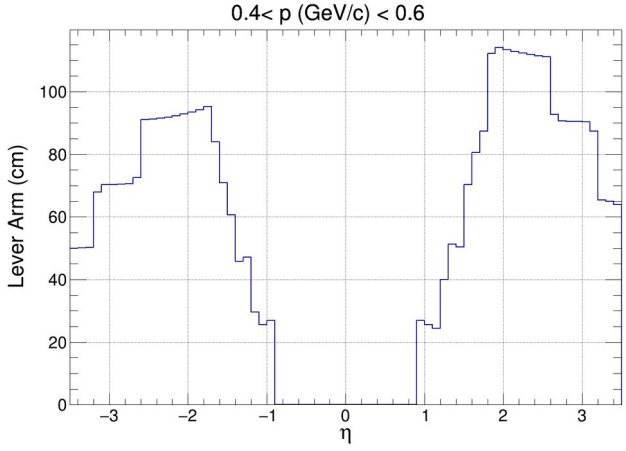


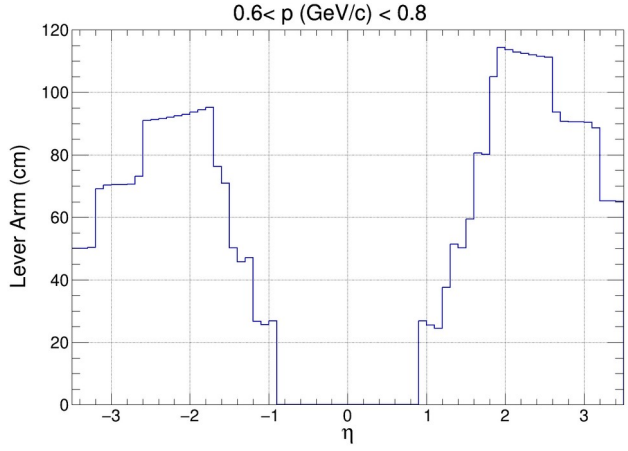


$$\frac{\Delta p_T}{p_T}|_{m.s.} = \frac{N}{\sqrt{(N+1)(N-1)}} \frac{0.0136\,\mathrm{GeV/c}}{0.3\beta B_0 L_0} \sqrt{\frac{d_{tot}}{X_0 \sin\theta}} \left(1 + 0.038 \ln \frac{d}{X_0 \sin\theta}\right)$$

Lever Arm is larger for η>0 which improves momentum resolution

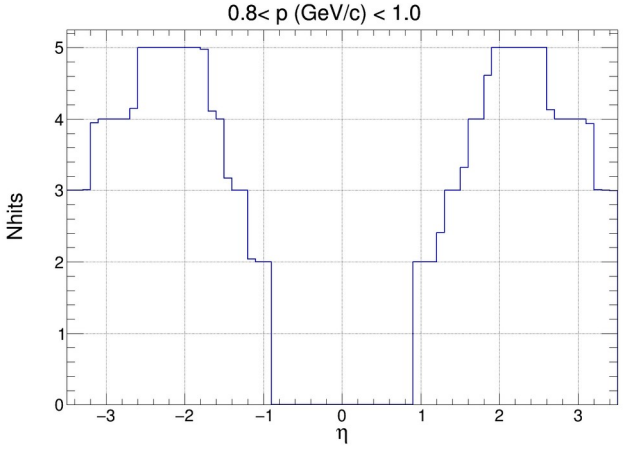


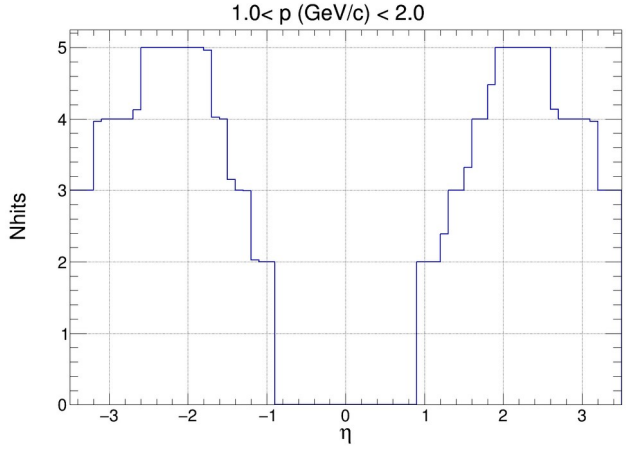


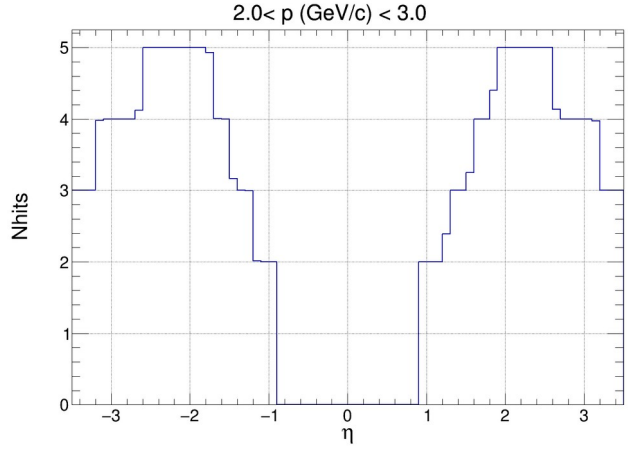


Nhits and Lever Arm for Disks (Generation Level)

3 hit case may bias the results

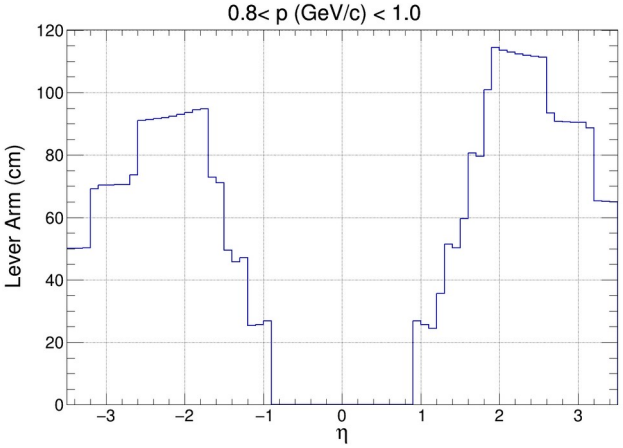


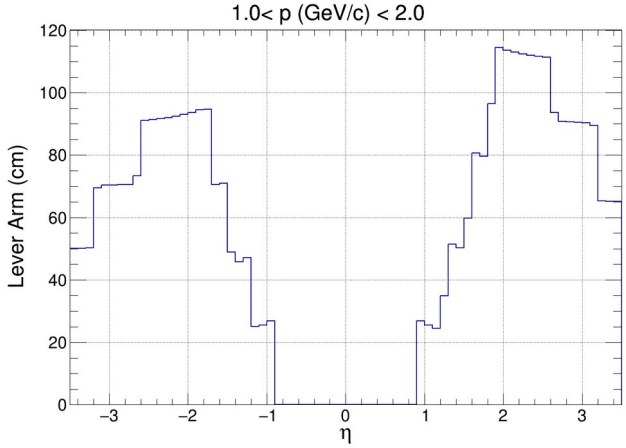


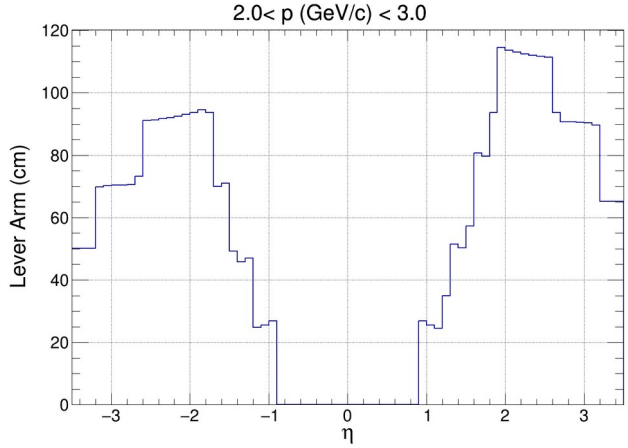


$$\frac{\Delta p_T}{p_T}|_{m.s.} = \frac{N}{\sqrt{(N+1)(N-1)}} \frac{0.0136\,\mathrm{GeV/c}}{0.3\beta B_0 L_0} \sqrt{\frac{d_{tot}}{X_0 \sin\theta}} \left(1 + 0.038 \ln \frac{d}{X_0 \sin\theta}\right)$$

Lever Arm is larger for η>0 which improves momentum resolution







Comparison with Expected (Ernst)

Summary

- Checked the number of Hits and Lever Arm using Monte Carlo points
- Very low momentum range (0.2-0.4 GV/c) we see because of the curling tracks we should see again this range after including Barrel Calorimeter (it makes simulation slow)
- Things to be done:
  - Currently writing trajectory plugin to have chi2/ndf, number of hits, etc.
  - Next Check the number of reco hits used in fitting and chi2/ndf
