# Significant changes

- ${}^6\text{Li}$
- ${}^{235}\text{U}$
- ${}^{239}\text{Pu}$

# ${}^6\text{Li}$ : Distinct changes are observed.

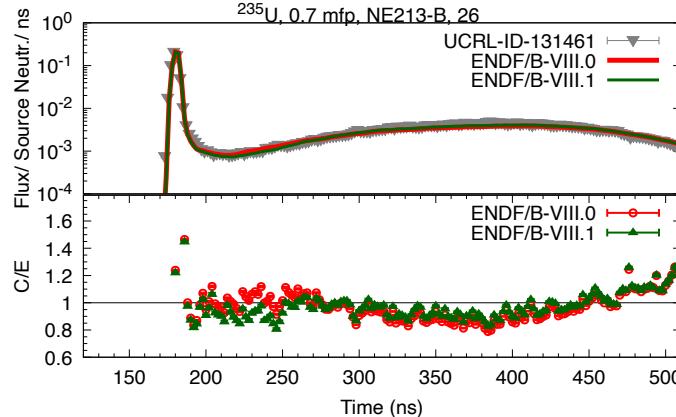

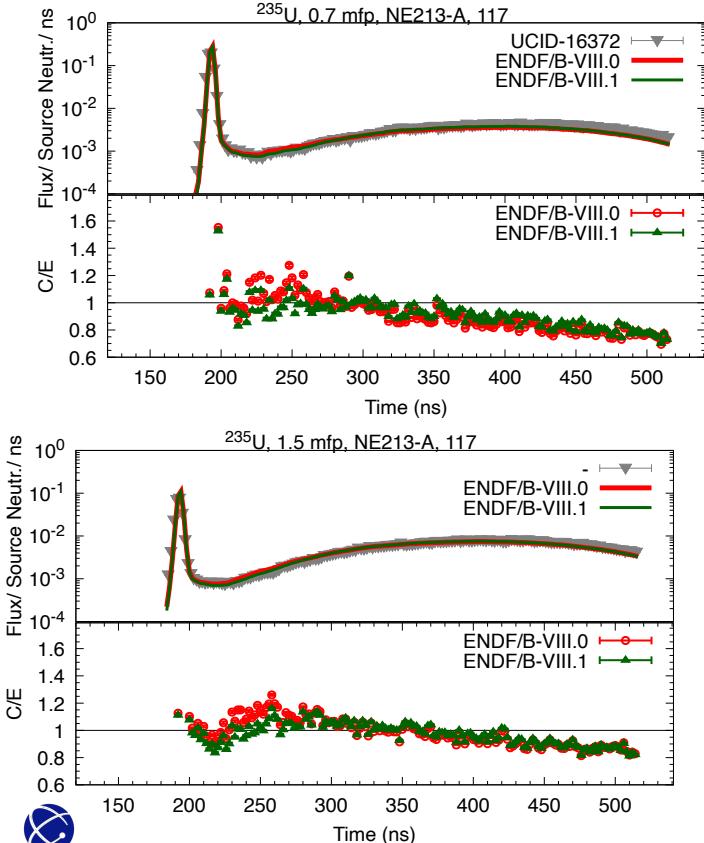

We discussed with G. Hale and M. Paris whether changes after peak could be caused by change of spectra for the  ${}^6\text{Li}(n,n')\text{d}$  alpha reaction from the laboratory to the c.m. system.

MF = {3,4} MT=53 could be studied.

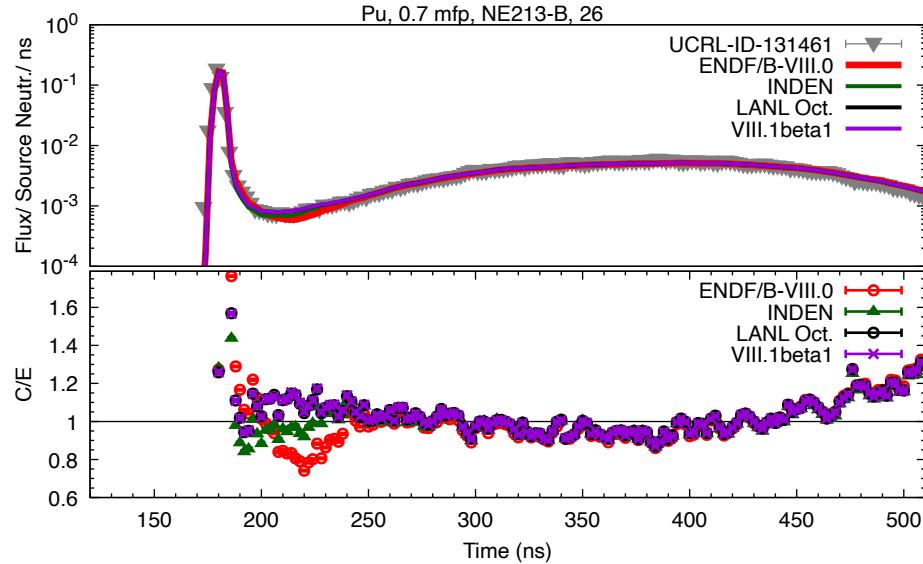

# $^{235}\text{U}$ : Improvements (seen in VIII.1beta0) are coming from new PFNS informed by Chi-Nu experimental data.

Chi-Nu data provided for the first time high-precision PFNS at  $E_{\text{inc}} = 14 \text{ MeV} \rightarrow$  changed PFNS in a direction that leads to better simulation of pulsed-sphere spectra.

# $^{239}\text{Pu}$ : large changes coming from inelastic scattering.

INDEN ... from ENDF/B-VIII.1beta0  
LANL Oct ... in-house LANL version that provided inelastic cross sections and angular distributions now in ENDF/B-VIII.1beta1

## VIII.1 Beta1:

- $(n,2n)$ ,  $(n,\gamma)$  ... INDEN
- $(n,inl)$ ,  $(n,el)$  ... LANL Oct.
- Fission source term ... same as for ENDF/B-VIII.1beta0

The changes we see are coming from inelastic cross sections and angular distributions ( $MF=\{3,4,6\}$ ). The continuum spectrum could play a large role.

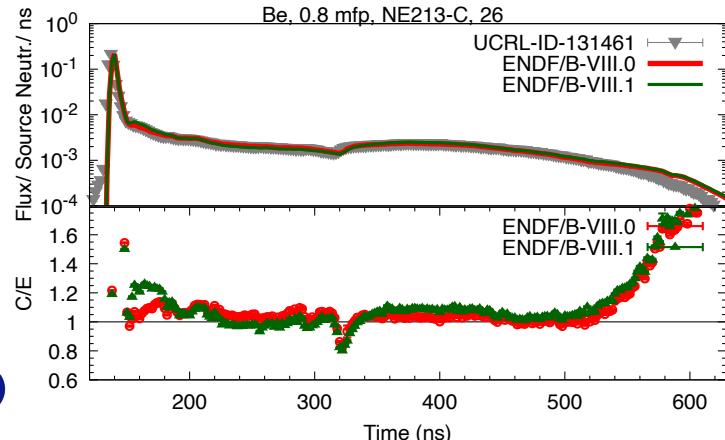

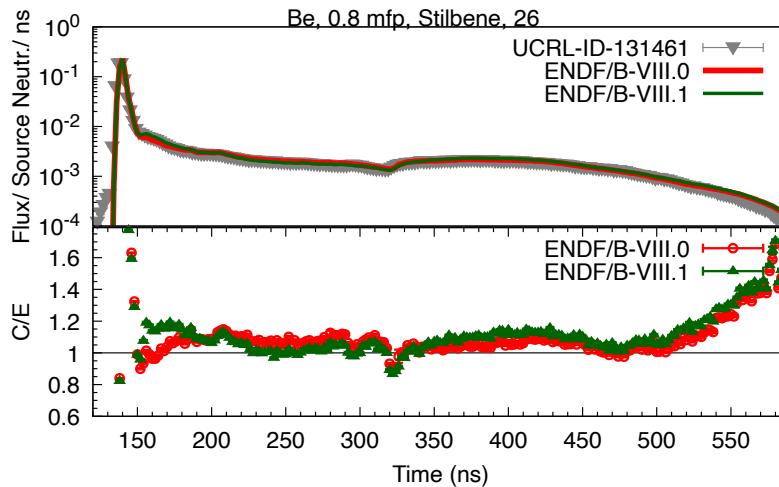

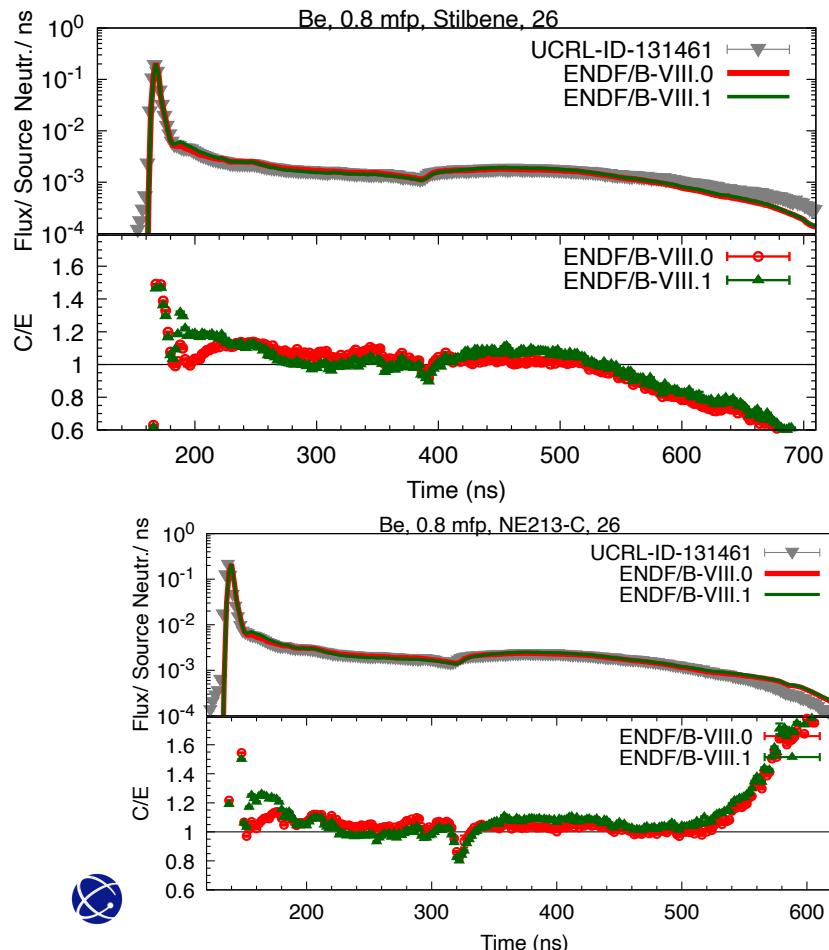

# Small to medium-sized changes

- ${}^9\text{Be}$
- ${}^{16}\text{O}$
- ${}^{19}\text{F}$
- ${}^{56}\text{Fe}$

# $^{9}\text{Be}$ : ENDF/B-VIII.0 better right after elastic peak.

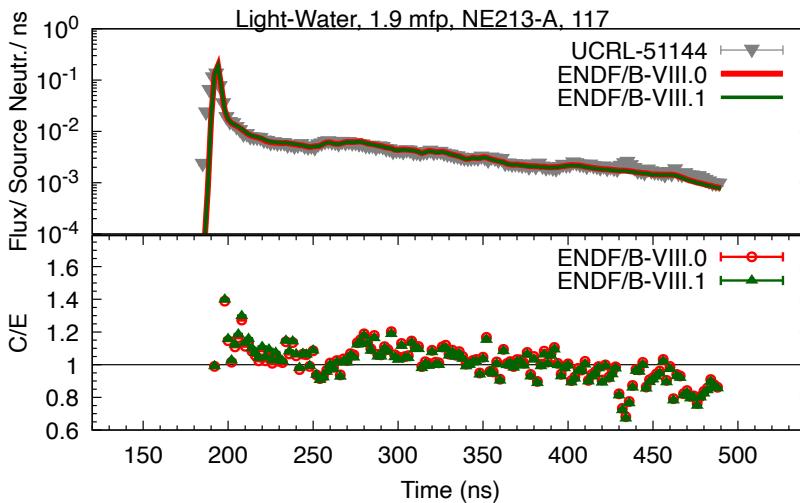

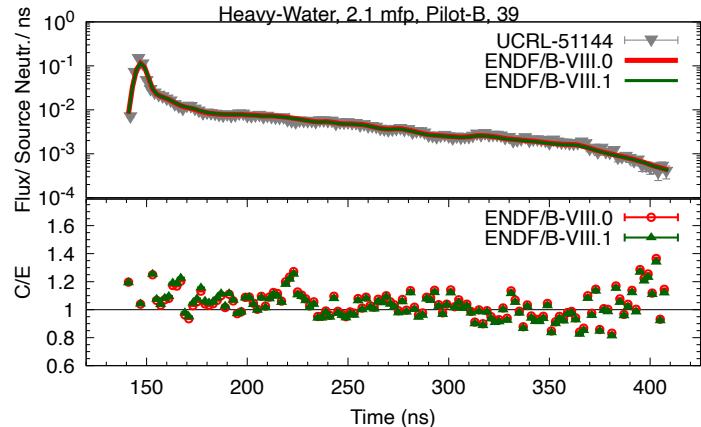

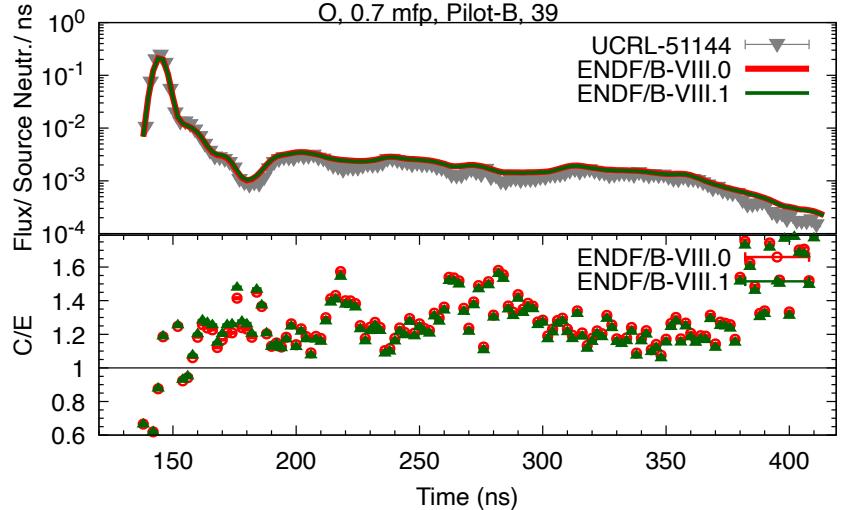

Less than 1 mfp  $\rightarrow$  on average < 1 scatter.

Changes could come from:

- ( $n,2n$ ) cs/ angular distribution,
- elastic angular distribution, or
- new ( $n,\text{inl}$ ) cs/ angular distribution (small).

# $^{16}\text{O}$ : Slight changes.

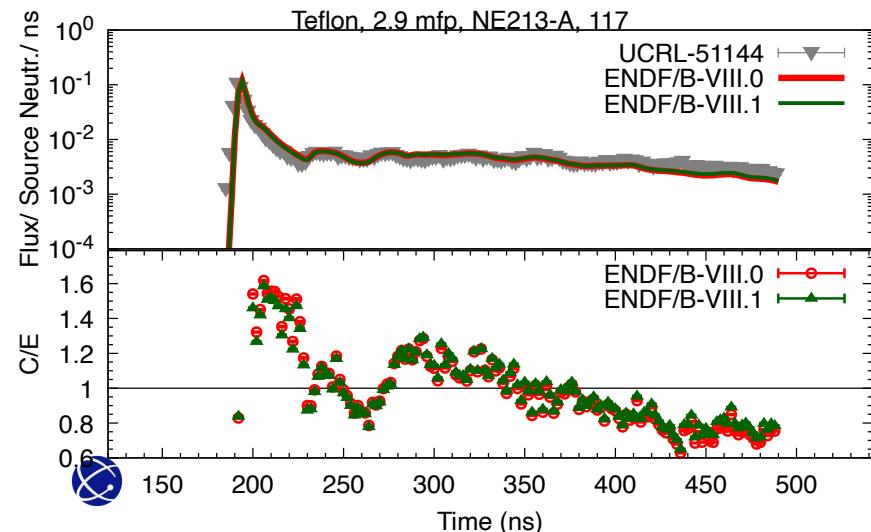

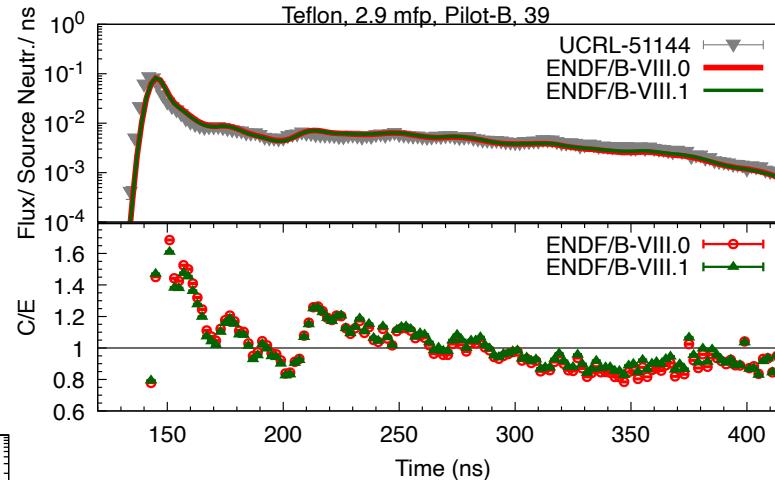

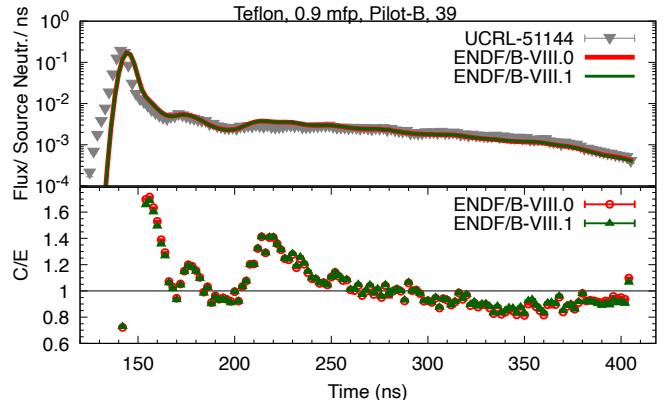

After the peak to 220 ns:

- MF=4, MT2,
- MF={3,4}, MT=52,

matter most.

# $^{19}\text{F}$ : small improvements in ENDF/B-VIII.1

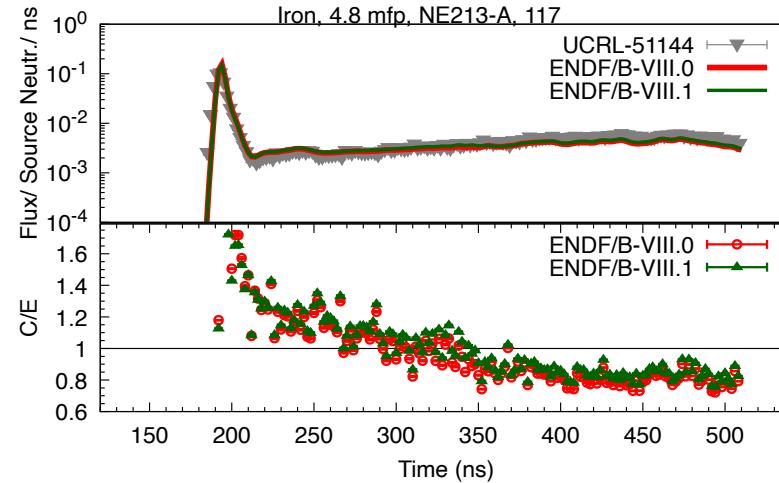

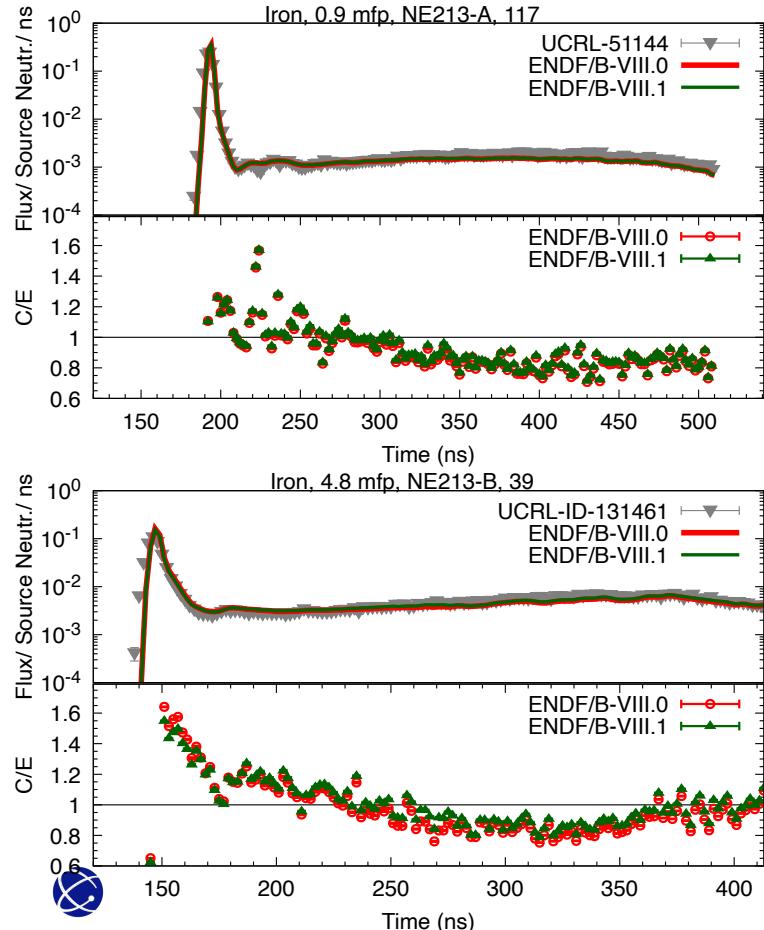

After the peak to :

- MF=4, MT2,
- MF={3,4}, MT=51,55,

matter most.

# $^{56}\text{Fe}$ : noticeable changes in thicker spheres.

Given more distinct changes in thicker spheres, inelastic multiple scattering ( $\text{MF}=\{3,4,6\}$ ) is likely an important contributor to changes.  
Look especially at  $\text{MF}=6$ ,  $\text{MT}=91$  for later times (after 200 ns).

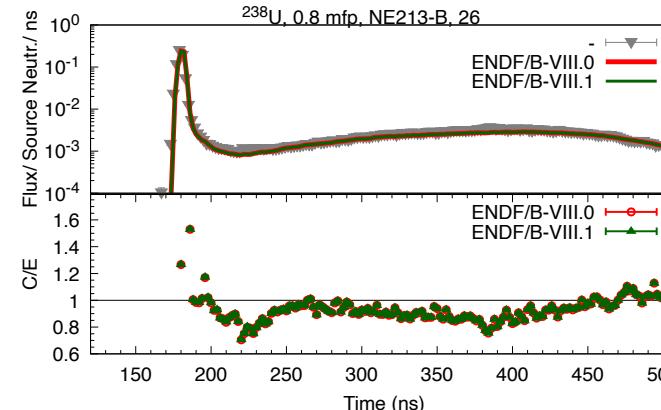

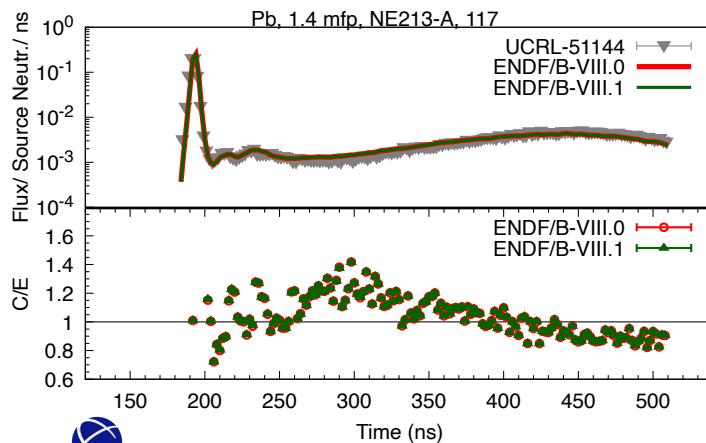

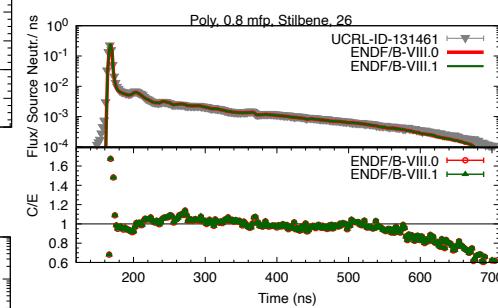

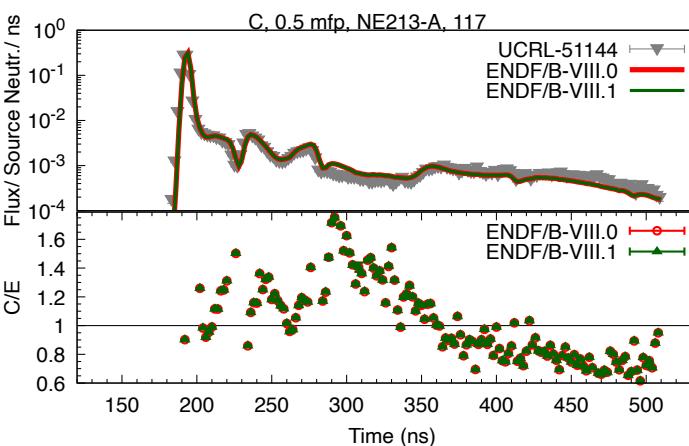

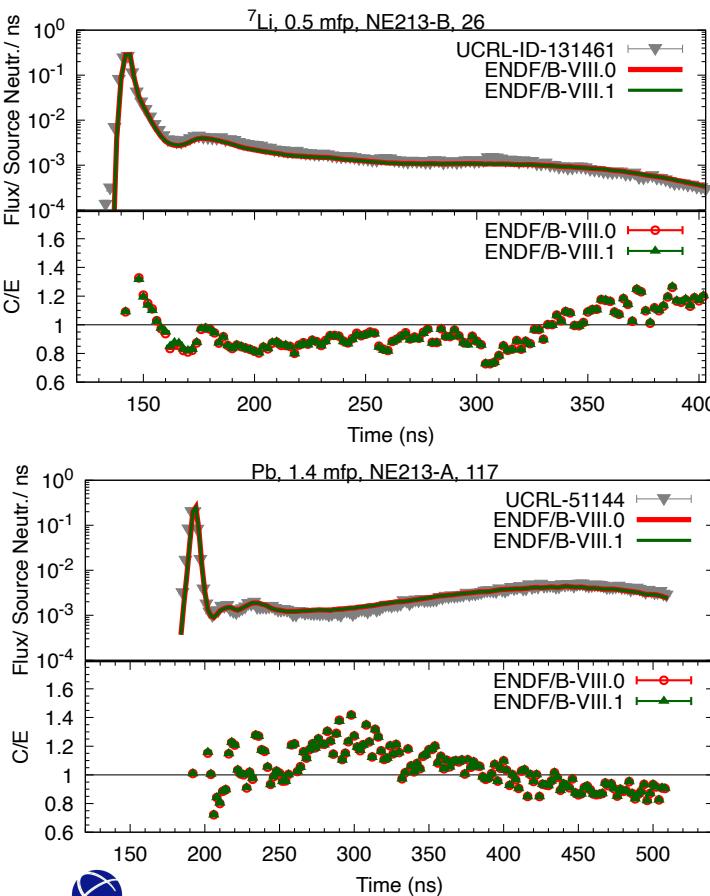

# Negligible changes

- $^7\text{Li}$
- $^{12,13}\text{C}$
- Pb
- $^{238}\text{U}$

# Examples of negligible changes for the sake of completeness.
