Backward HCal Overview

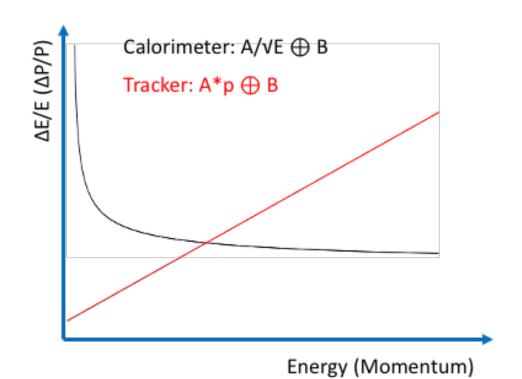

Brian Page

September 28, 2023

HCal Function at the EIC

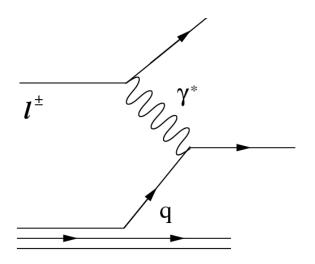

- ☐ Particles and jets will have relatively low momenta except in the forward region track momentum resolution superior to calorimeter resolution for much of the phase space
- ☐ Track momentum + PID = Energy determination
- □ Hadron calorimeters needed for measurements of neutral hadrons (neutrons and K_L)
- ☐ Possible muon ID? KLM?

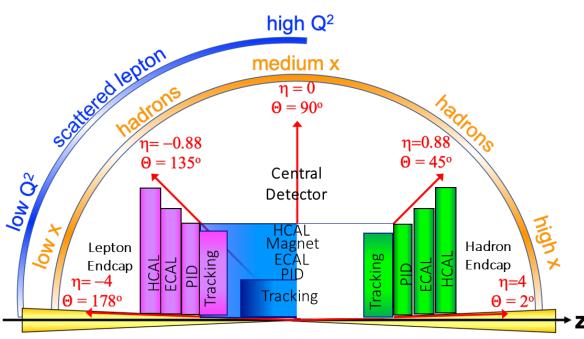

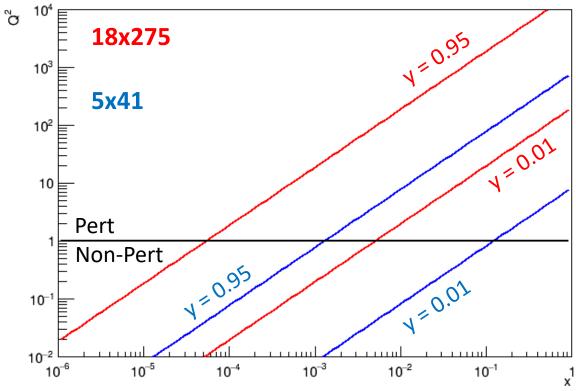

- ☐ As particle energy increases, calorimeter resolution
- improves while tracker resolution degrades
- ☐ Tracker resolution and acceptance degrades at forward rapidity/backward
- ☐ Smaller particle momentum in backward regions calorimeter as a neutral veto

DIS Event Kinematics

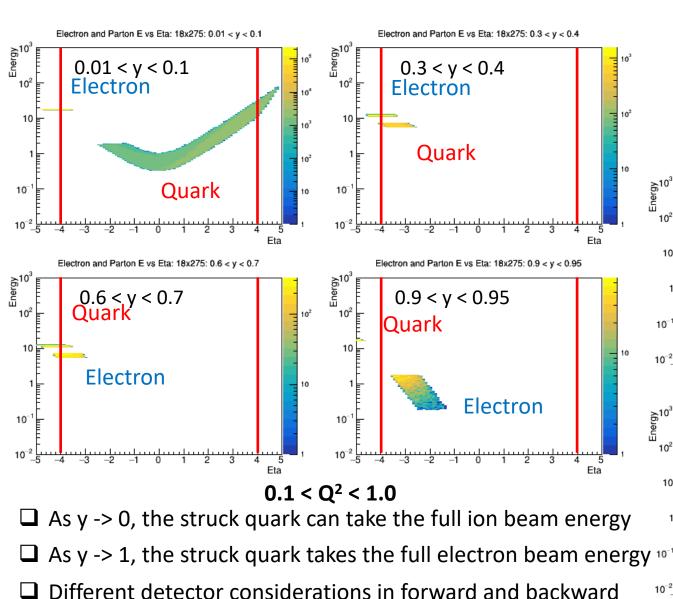

EIC Phasespace

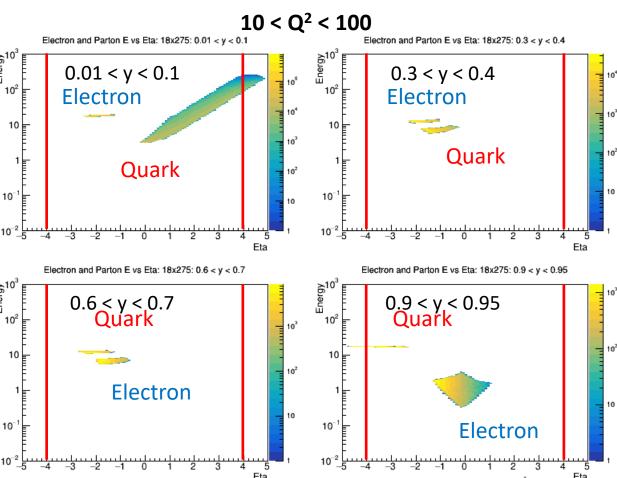

- \Box For the leading order process, jet location and energy are dictated by the event kinematics (x, Q^2 , y)
- ☐ For a given Q², inelasticity determines x value probed and pseudorapidity of the jet
 - ➤ Low y -> high x, jet at positive pseudorapidity
 - ➤ High y -> low x, jet at negative pseudorapidity

Electron and Struck Quark (18x275)

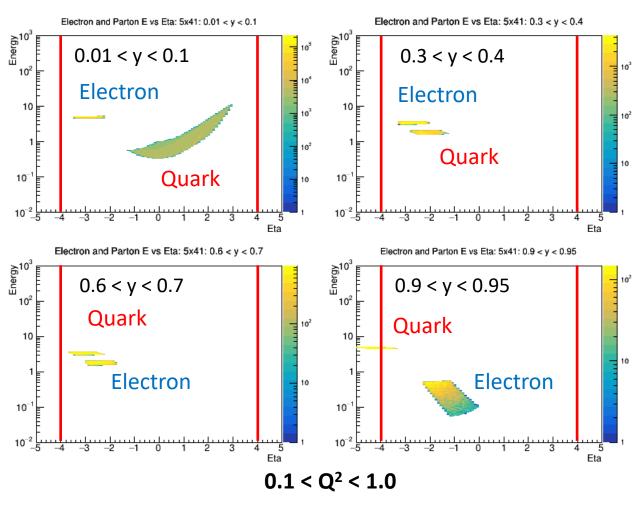

regions

- Look at energy vs pseudorapidity of the scattered electron and struck quark as a function of y and Q²
- ☐ For fixed Q², as y increases, electron eta increases while parton eta decreases

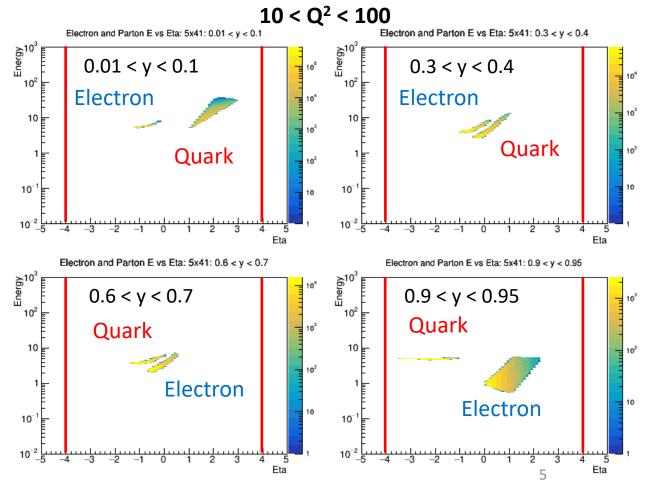

Electron and Struck Quark (5x41)

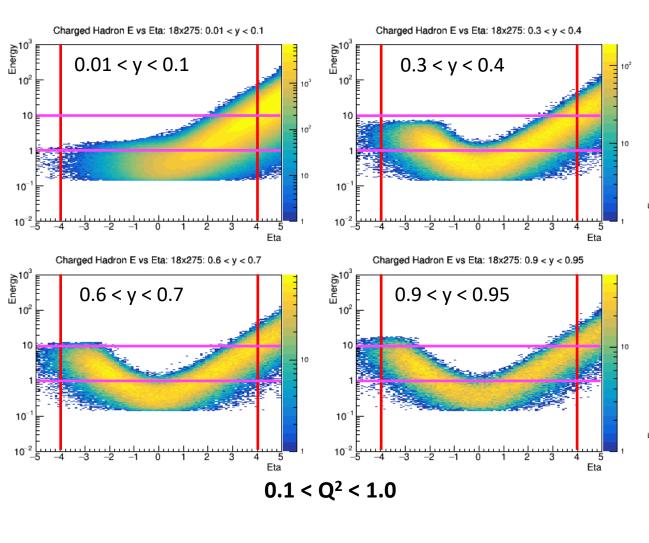

☐ As Q² increases, both the scattered electron and struck quark move to larger eta for all values of y

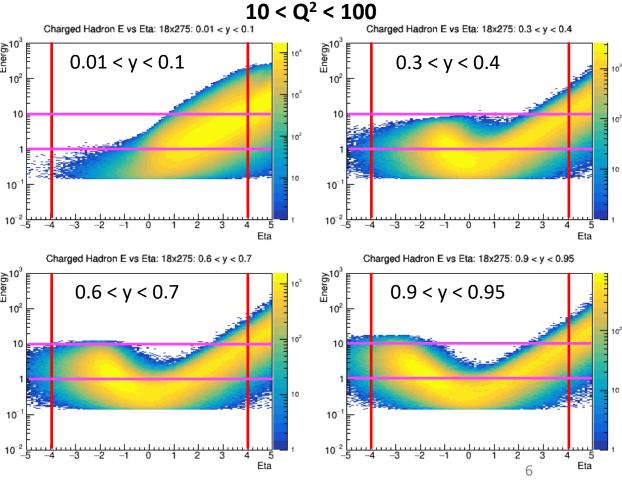

☐ Maximum parton / jet energy in. the backward region will be determined by the electron beam energy

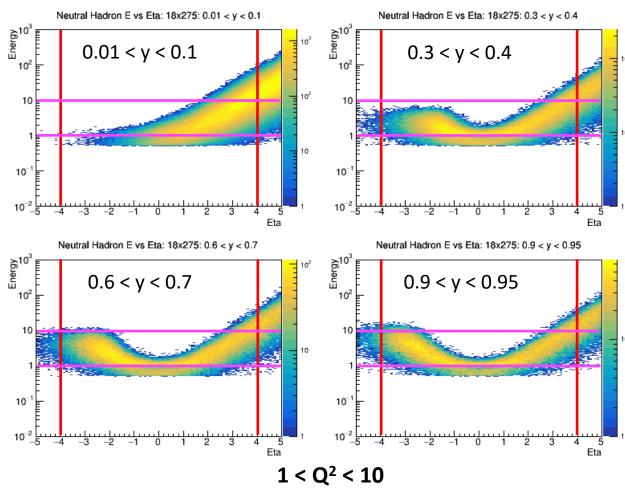

(Charged) Particle Distributions (18x275)

☐ Charged hadron energy vs eta distributions all show roughly similar features — high energy forward, low at mid-rapidity, and a slight rise in the backward region

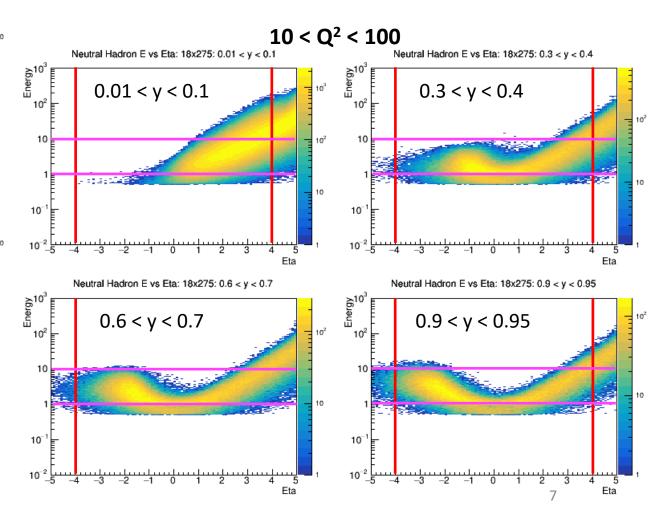

Neutral Hadrons (18x275)

- ☐ How well can we reconstruct the parton kinematics from these particles?
- ☐ Can we form jets away from the struck parton?

- Neutral hadron energy vs eta distributions very similar to charged particles
- ☐ Minimum energy is larger due to rest mass of the K_L

Jet Algorithms

Anti_k_T

$$d_{ij} = \min[p_{ti}^{-2}, p_{tj}^{-2}] \Delta R_{ij} / R$$

EE_kT (Spherically Invariant)

$$d_{ij} = 2 * \min[E_i^2, E_j^2](1 - \cos \Delta_{ij})$$

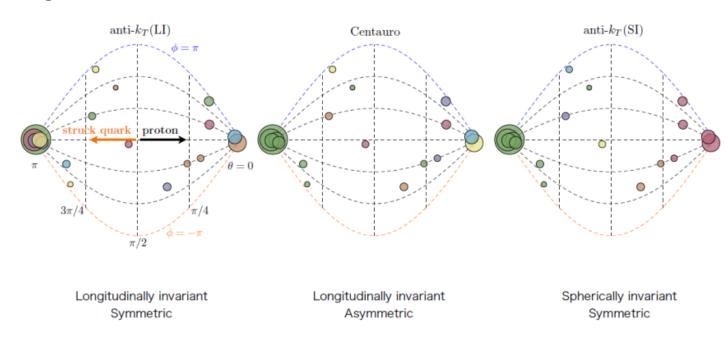

Centauro

$$d_{ij} = \left[(\Delta f_{ij})^2 + 2f_i f_j (1 - \cos \Delta \phi_{ij}) \right] / R^2$$

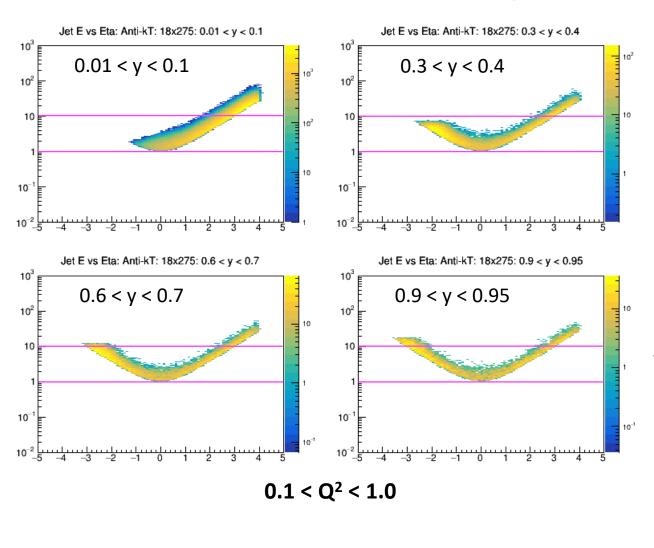

Asymmetric measure is necessary

$$f(x) = x + \mathcal{O}(x^2) \qquad \bar{\eta}_i = -\frac{2Q}{\bar{n} \cdot q} \frac{p_i^{\perp}}{n \cdot p_i}$$
$$\bar{\eta}_i(BF) = 2p_i^{\perp}/p_i^{+}$$

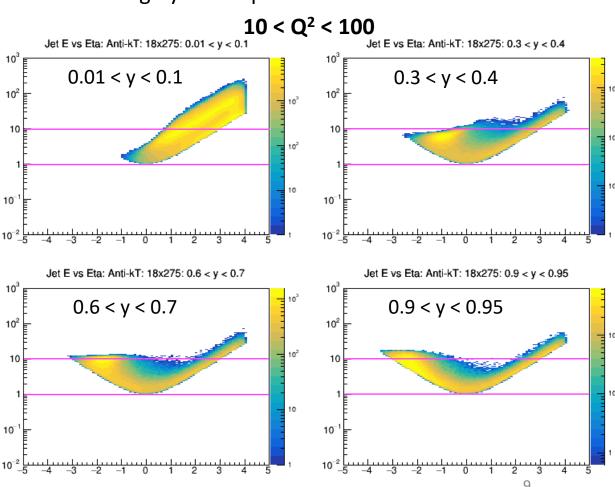

- ☐ Sequential recombination algorithms, especially Anti_k_T, have been the "industry standard" at hadron colliders for a number of years
- ☐ Is this appropriate for very forward jets or Born-level jets in the Breit frame where transverse momenta are by definition small?
- Look at alternative distance measures such as spherically invariant and symmetric EE_k_T or longitudinally invariant and anti-symmetric centauro algorithms

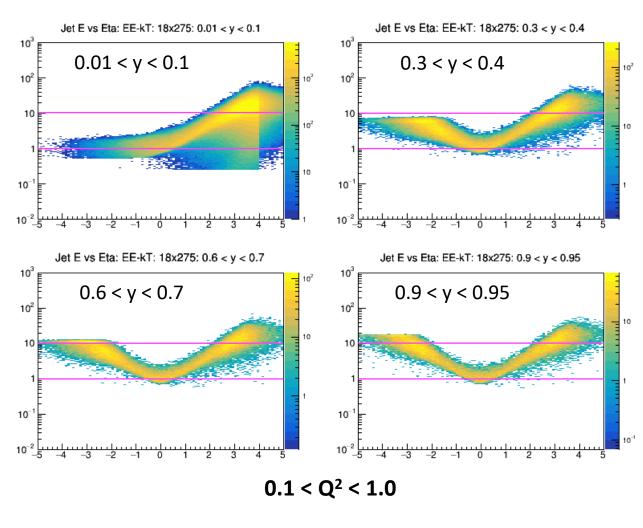

Jet Distributions: Anti_k_T (18x275)

- Run inclusive Anti_ k_T on all stable particles (|eta| < 4) with 1 GeV minimum p_T cut
- ☐ Jets roughly follow particle distributions

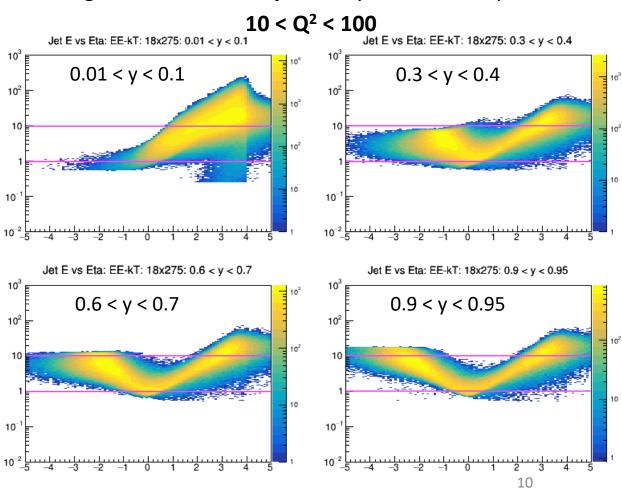

Jet Distributions: EE_k_T (18x275)

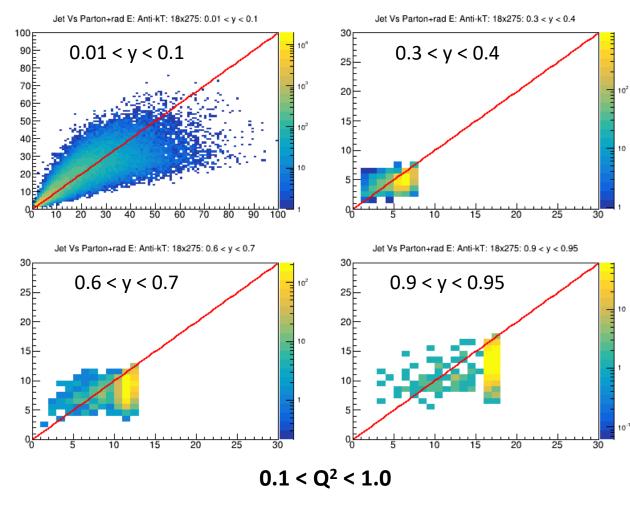

☐ Need to understand the artifact around eta = 4, must be related to particle eta cut

- ☐ Overall distributions are similar for EE_k_T algorithm
- ☐ In general, see larger number of jets, more jets at higher eta, and more jets away from struck quark

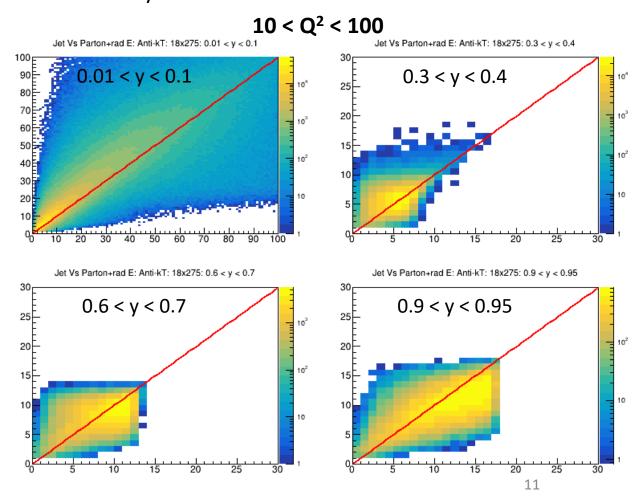

Jet – Parton Energy Comparison: Anti_k_T (18x275)

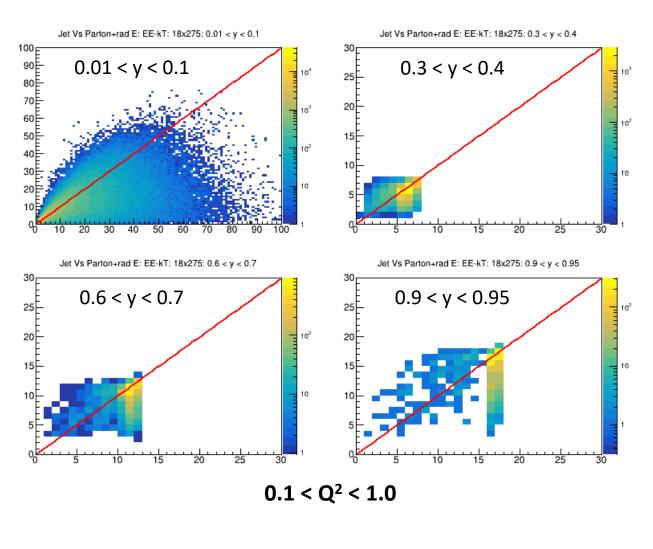

☐ Performance degrades somewhat at larger y (backward jets)

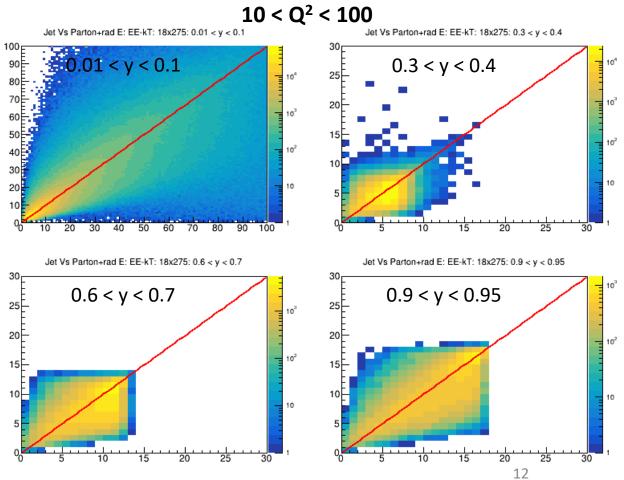

- ☐ How well do jets represent the parton?
- ☐ Plot jet energy vs parton+FSR energy for different Q² and inelasticity

Jet – Parton Energy Comparison: EE_k_T (18x275)

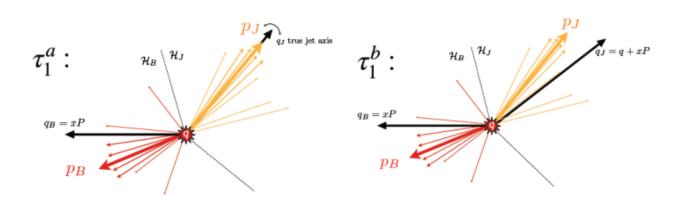

■ Better agreement between parton and jet seen with EE_kT algorithm, especially at high y

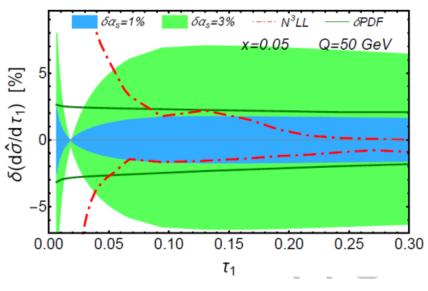

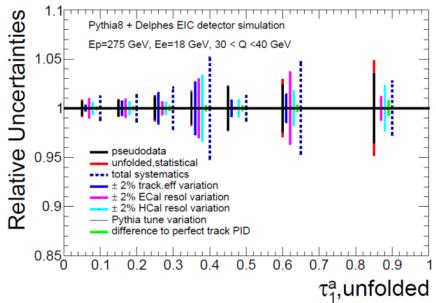

☐ Hermiticity

- ➤ Determination of event kinematics especially for photoproduction and CC where we rely on hadronic reconstruction
- Precision event shape measurements want to know as well as possible distribution of particles/energy

$$\tau_1 = \frac{2}{Q^2} \sum_{i \in X} \min\{q_B \cdot p_i, q_J \cdot p_i\}$$

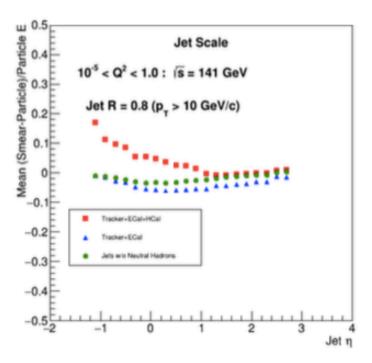

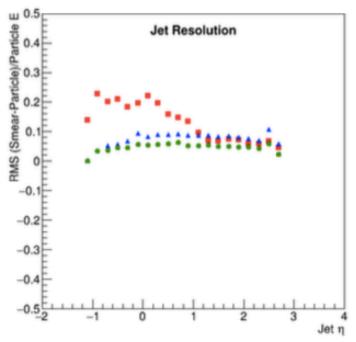

☐ Hermiticity

- Determination of event kinematics especially for photoproduction and CC where we rely on hadronic reconstruction
- Precision event shape measurements want to know as well as possible distribution of particles/energy

Jet Reconstruction

- ➤ Fast simulation studies have indicated that JES and JER can be greatly improved in the barrel and backward region by tagging neutral hadrons
- Needs study in full simulation

☐ Hermiticity

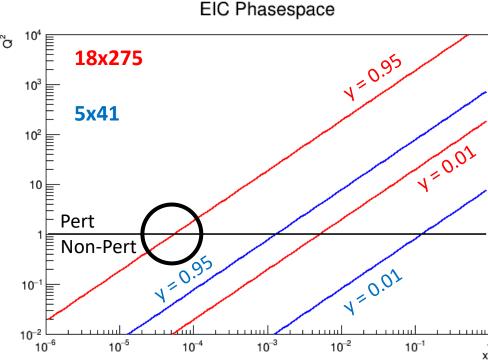

- ➤ Determination of event kinematics especially for photoproduction and CC where we rely on hadronic reconstruction
- Precision event shape measurements want to know as well as possible distribution of particles/energy

Jet Reconstruction

- Fast simulation studies have indicated that JES and JER can be greatly improved in the barrel and backward region by tagging neutral hadrons
- Needs study in full simulation

Low-x and Saturation

Lowest x values correspond to high inelasticity – hadronic activity goes to negative eta

☐ Hermiticity

- ➤ Determination of event kinematics especially for photoproduction and CC where we rely on hadronic reconstruction
- Precision event shape measurements want to know as well as possible distribution of particles/energy

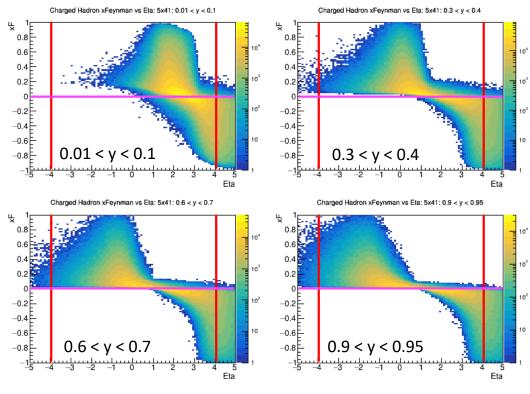

Jet Reconstruction

- ➤ Fast simulation studies have indicated that JES and JER can be greatly improved in the barrel and backward region by tagging neutral hadrons
- Needs study in full simulation

Low-x and Saturation

- Lowest x values correspond to high inelasticity hadronic activity goes to negative eta
- ☐ Target Vs Current Fragmentation

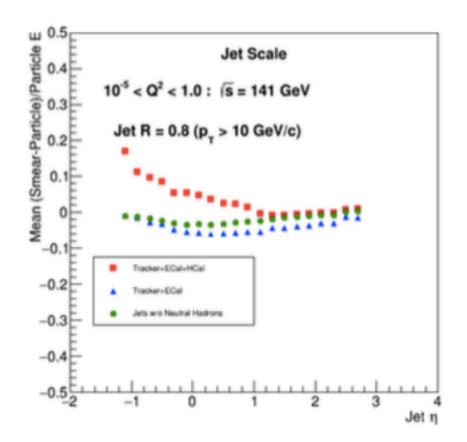

5x41: 10 < Q2 < 100

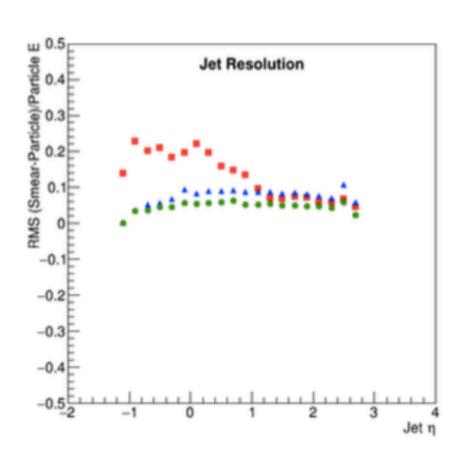

- ☐ Define xF as 2*particle_pZ/W in the hadronboson center of mass frame
- ☐ Z-axis defined w.r.t. the virtual photon 16

Backup

HCals in the Yellow Report: Neutral Veto

- ☐ Yellow report era studies saw that neutral hadrons can spoil JES and JER for low energy jets
- Vetoing jets with neutral hadrons using the HCal could substantially improve resolution
- ☐ This was very primitive detector effects modeling
- Need to confirm in modern full simulation

Figure 8.57: Demonstration of the effect of selecting only jets which do not contain a neutral hadron (green circles) on the jet energy scale (left) and resolution (right) as compared to the cases when all subsystems are used in jet finding (red squares) and when HCal information is excluded (blue triangles).

HCals in the Yellow Report: Resolution

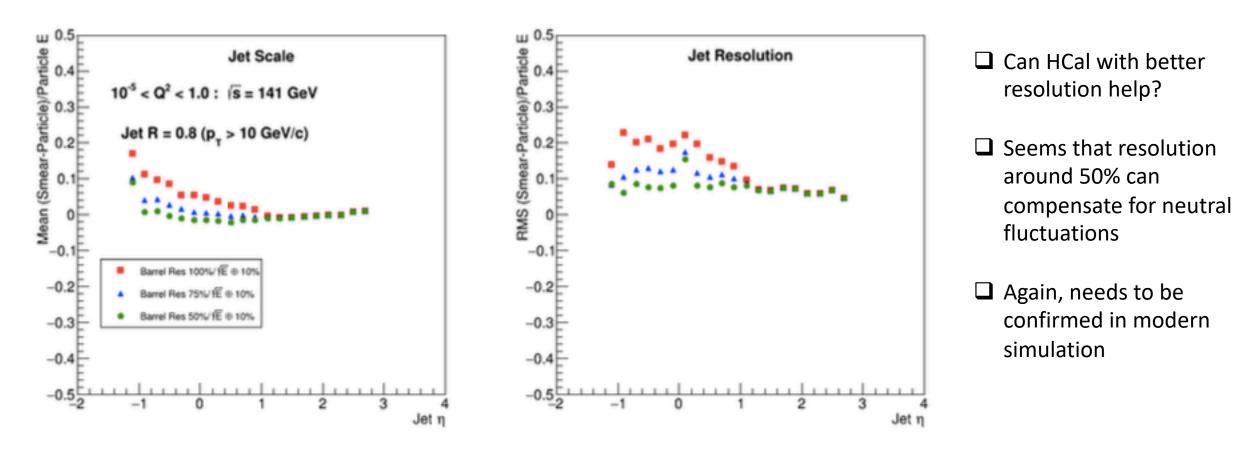

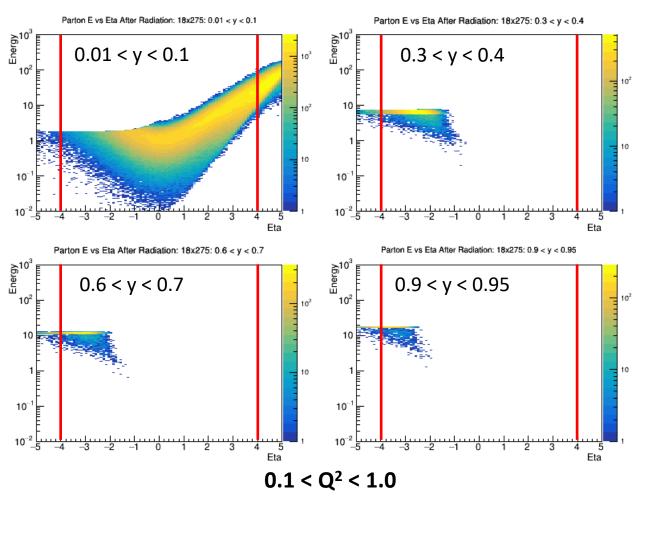

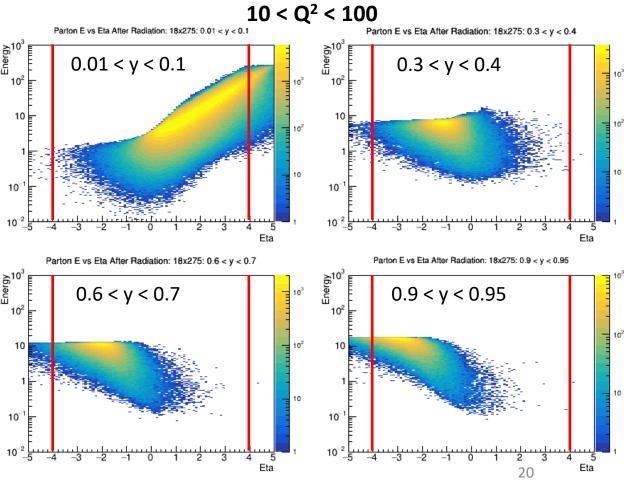

Figure 8.56: Jet energy scale (left) and resolution (right) as a function of jet pseudorapidity when selecting smeared jets with $p_T > 10 \text{ GeV}/c$ for different values of HCal energy resolution: $100\%/\sqrt{E} \oplus 10\%$ (red squares), $75\%/\sqrt{E} \oplus 10\%$ (blue triangles), and $50\%/\sqrt{E} \oplus 10\%$ (green circles).

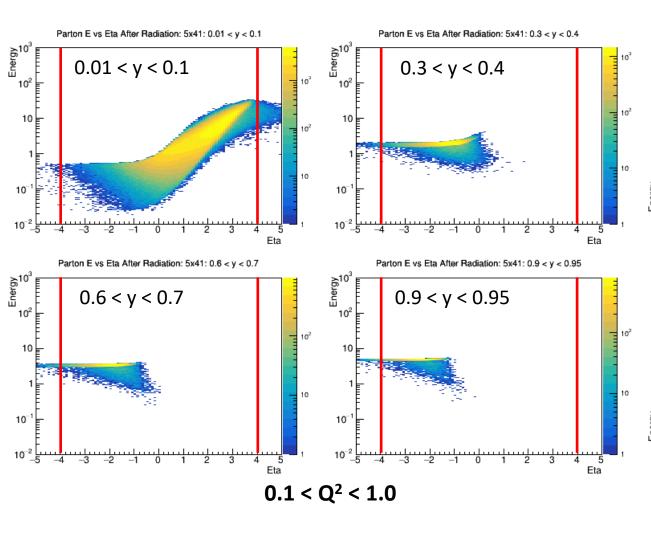

Struck Quark + FSR (18x275)

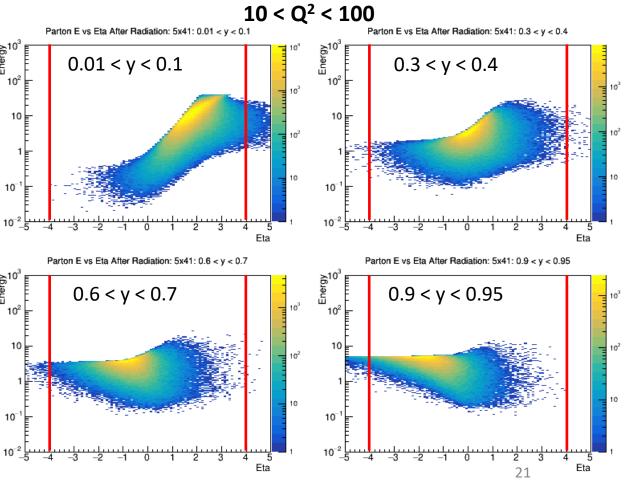

- ☐ For Born-level process, struck quark kinematics are correlated with event kinematics
- ☐ Final state radiation can alter quark kinematics significantly

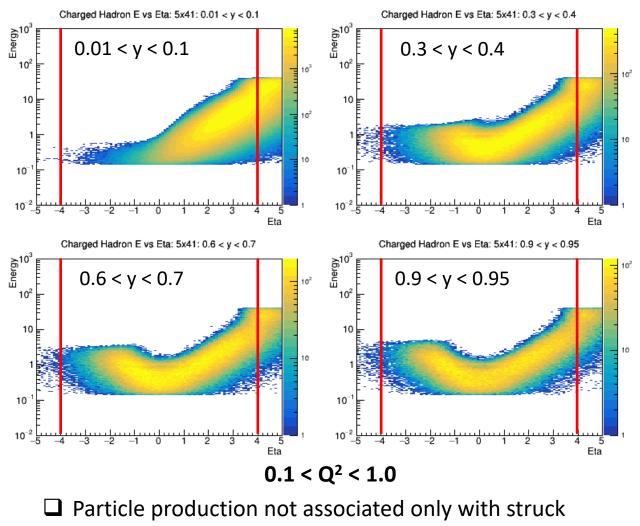

Struck Quark + FSR (5x41)

☐ Behavior as a function of Q², y, and beam energy is still seen

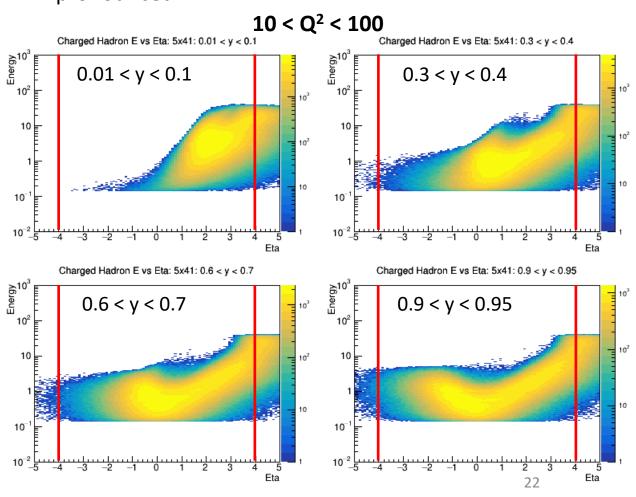

(Charged) Particle Distributions (5x41)

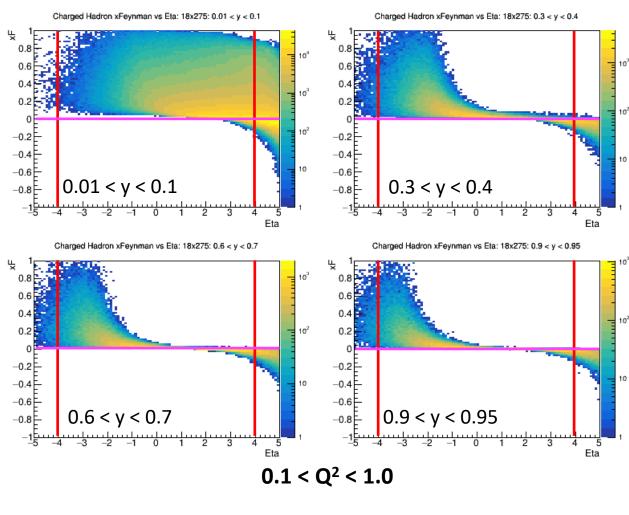

- parton
- ☐ Gammas and neutrals follow same pattern

- Of course, it is final state hadrons which are measured
- Differences with y and Q2 are now somewhat less pronounced

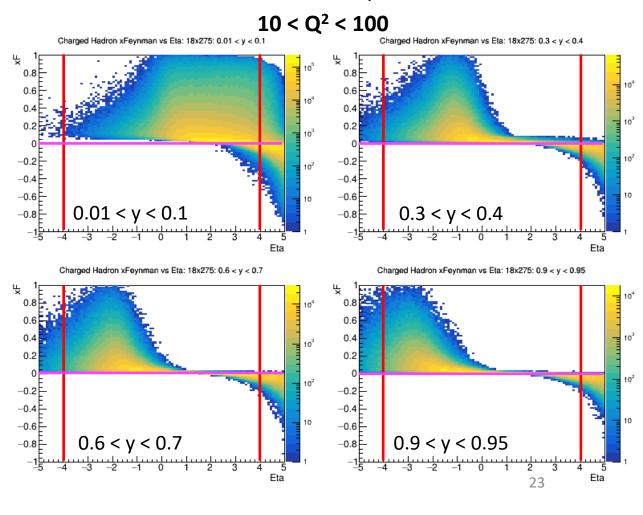

(Charged) Particle x-Feynman (18x275)

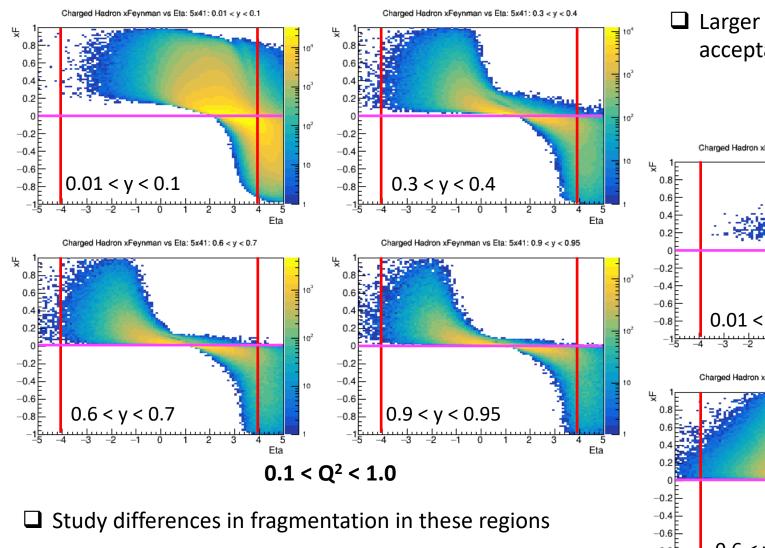

☐ Positive xF indicates particles more associated with the struck quark

- ☐ Define xF as 2*particle_pZ/W in the hadron-boson center of mass frame
- ☐ Z-axis defined w.r.t. the virtual photon

(Charged) Particle x-Feynman (5x41)

☐ Look at correlations between these regions

☐ Larger negative xF particles come into the detector acceptance for lower beam energies
