LFHCal, Event 30
 e-p: 18x 275 GeV, $Q^2 > 100$ GeV

- **8M & 4M modules:**
 read out in 7 layers longitudinally (5 or 10 SiPMs summed)
 desirable min measurable tower energy < 0.5 MIP/segment, max. ≈ 1500 MIP/segment
 ideally even just 1 MIP in tile detected
 → 565,760 SiPMs, 60,928 read-out channels
- **insert modules:**
 read out every single tile
 desirable min measurable energy < 0.5 MIP/tile , max. ≈ 500 MIP/tile
 23400 SiPMs/tiles & read out channels
- 1 MIP = 600-700MeV in LFHCal tile & 500 MeV in insert tile
- pedestral for summed layers to be validated (only guess right now)
- intrinsic noise will dependent on rad. damage
