

ML for Beam Polarization Increase

Accepted ML / AI Proposal to DOE-NP FOA

Georg Hoffstaetter de Torquat Collider-Accelerator Department, BNL and Cornell University Georg.Hoffstaetter@cornell.edu

CAD MAC

December 20, 2023

DE-FOA-0002875 : ARTIFICIAL INTELLIGENCE AND MACHINE LEARNING FOR AUTONOMOUS OPTIMIZATION AND CONTROL OF ACCELERATORS AND DETECTORS

Title: Higher RHIC polarization by Physics-informed Bayesian Learning Budget: \$1.5M, duration 2 years, start 09/01/2023 to BNL, Cornell, JLAB, SLAC, RPI Funding through DOE-NP DE SC-0024287, contr.# 2023-BNL-AD060-FUND Funding officer Manouchehr Farkhondeh

Requested topics:

- Efficiently extract critical and strategic information from large complex data sets
- Address the challenges of autonomous control and experimentation
- Efficiency of operation of accelerators and scientific instruments
- Al for data reduction of large experimental data

C-AD MAC

Desired result: higher proton polarization

- What high-impact operational challenge can be addressed by MI/AI?
 → Polarized protons.
- From the source to high energy RHIC experiments, 20% polarization is lost.
- Polarized luminosity for longitudinal collisions scales with P⁴, i.e., a factor of 2 reduction!
- The proton polarization chain depends on a hose of delicate accelerator settings form Linac to the Booster, the AGS, and the RHIC ramp.
- Even 5% more polarization would be a significant achievement. © Brookhaven Georg.Hoffstaetter@cornell.edu C-AD MAC 20 December 2023.

Outline

- Objective of proposed work: higher proton polarization in RHIC and the EIC.
- Polarized-proton acceleration chain.
- Potential avenues toward higher proton polarization.
- (1) Emittance reduction
- (2) More accurate timing of timed elements
- (3) Reduction of resonance driving terms
- Started Activities
- Gaussian Process (GP) Bayesian Optimization (BO) and physics informed learning.
- When is ML/AI better for accelerator operations than other feedbacks and optimizers?

C-AD MAC

The polarized proton accelerator chain

Georg.Hoffstaetter@cornell.edu

C-AD MAC

Georg.Hoffstaetter@cornell.edu

C-AD MAC

Topics that can improve polarization

- (1) Emittance reduction
- (2) More accurate timing of tune jumps
- (3) Reduction of resonance driving terms

C-AD MAC

Emittance reduction → less depolarization

- Optimized Linac to Booster transfer
- Optimized Booster to AGS transfer
- Optics and orbit correction in Booster and AGS
- Beam-based Quadrupole calibration from ORM in Booster and AGS.
- Bunch splitting in the Booster for space charge reduction and bunch re-coalescing at AGS top energy.

C-AD MAC

Linac to Booster transfer

Parameters to vary:

- Transfer line steers
- Main Booster dipol90e field
- Booster beta wave (stop-band quadrupoles) for tune toward ½ and minimum on the foil
- Last two linac phases
- Injection bump elements and their time profile
- Scraper amplitudes

Observables to optimize:

- Transfer efficiency linac → Booster early ramp (2% absolute)
- Emittance from multi wires of the AGS transfer line (5% relative)

C-AD MAC

Booster to AGS transfer Parameters to vary:

- Transfer line steerers
- Main AGS dipole field
- AGS RF phase
- Amplitudes of two Injection bumps
- Horizontal orbit in the snakes
- Quadrupole corrections for the snakes
- Injection to accelerator tune change

Observables to optimize:

Transfer efficiency Booster → AGS early ramp (2% absolute)

Brookhaven - Emittance from two IPMs (10% relative) Georg.Hoffstaetter@cornell.edu
C-AD MAC 20 December 2023.

Response Error model for the ORM

- Scan through some common sources of error to see how much ORM changes
- Find relevant parameters to include for building error-detecting model
- Goal: establish a neural network that identify error source given a measured ORM

11

Sensitivity studies: error sources

- Sources or error and ranges come from past survey data
- Criteria to quantify & visualize sensitivity:
 - RMS of ORM matrix
 - Beta-beating (vertical & horizontal)

$$\frac{\Delta\beta}{\beta} = \frac{\beta_{measured} - \beta_{model}}{\beta_{model}}$$

Name	Unit	Range
Main magnet roll error	mrad	[-0.5, 0.5]
Main magnet gradient error	m ⁻²	$\pm 0.1\%$
Quadrupole gradient error	m-2	± 0.2%
Sextupole offset error	mm	[-8, 8]
Snake magnet roll error	mrad	[-1.5, 1.5]

C-AD MAC

Where do we put AI/ML?

- ORM will give us
 - BPM and Corrector Anomalies (Trust Analysis)
 - Gradient errors for given conditions
 - Beta-deviations from model
- Dispersion measurements give us
 - BPM Consistency check for given dp/p (BPM Anomalies)
 - Coupling through longitudinal motion (very slow, typically)
- Tune measurements
 - Betatron tune and coupling = destructive measurement in Booster/AGS
 - Tune, Chrom, coupling, emittance, dp/p from RHIC Schottky
- Chromaticity measurements need to change energy and measure tune
- Orbit Measurements parasitic = most are time averaged, some turn by turn
- Linear model + small nonlinearities with NN model

Orbit & Optics correction in Booster / AGS

Parameters to vary:

Corrector coils (24 per Booster plane)

Corrector coils (48 per AGS plane)

Observables to optimize:

BPM readings (24 x&y in the Booster) (100um accuracy) BPM readings (72 x&y in the AGS) (100um for 2mm size at 25GeV)

C-AD MAC

Space-charge emittance increase

Figure 3.168: Normalized transverse emittances of polarized proton beam at AGS extraction energy ($\gamma = 25.5$) as a function of intensity.

Brookhaven National Laboratory Georg.Hoffstaetter@cornell.edu → Splitting bunches before AGS acceleration can reduce the emittance. ^{20 December 2023.}

15

Bunch splitting / coalescing

Rf gap voltages, harmonics, and cavities involved in the standard 4:2:1 Booster merge used for EBIS Au. The x-axis is ms from Bt0 and the y-axis is the voltage reference. The h=2 cavity has 2 gaps, and A3 and B3 have 1 gap. So, since both A3 and B3 are used for h=4 and h=1 the relative voltages here should be correct.

Splitting in the booster and coalescing after AGS accelerator reduces space charge and emittance growth \rightarrow more polarization

Georg.Hoffstaetter@cornell.edu

C-AD MAC

Bunch splitting and coalescing

Parameters to vary:

3 RF amplitudes and phases, and their timing

Observables to optimize:

Mountain range width (5% relative)

Mountain range oscillations (10% of a sigma)

Baby-bunch currents (2%)

Emittance in the multi-wire to the AGS (5% relative)

Emittance from two IPMs (10% relative)

C-AD MAC

Timing of tune jumps

The G-gamma meter and accurate energy vs. time

- (1) Measure the energy by orbit + revolution frequency measurement
- (2) Measure of energy by field + revolution frequency measurement

(3) Measure energy by spin flip at every integer spin tune

Combined optimization

- → better timing
- ➔ higher polarization

Improved energy timing

Parameters to vary:

Time profile of the time-jump quadrupoles

Observables to optimize:

Revolution frequency (1.E-6)

Radial offset from BPM readings (20mu average)

Main dipole fields Hall-probe at injection (0.1%) + integrating coil (2%)

E(t) by measure f(t), x(t), B(t), P(t)

Sational Laboratory <u>Georg.Hoffstaetter@cornell.edu</u>

C-AD MAC

Reduction of AGS resonance driving terms

· Currently handled with fast tune jump

rotation)

never met

Partial snakes drive horizontal depolarizing resonances

Brookhaven National Laboratory Georg.Hoffstaetter@cornell.edu

Compensate by other coupling elements, e.g., skew quads C-AD MAC 20 December 2023. 20

 $[\]Delta Q_x = 0.04, 100 \ \mu s$

Reduction of AGS resonance driving terms

- Two snakes, separated by 1/3 circumference
 - Modulated resonance amplitude highest near Gy = 3N (when snakes add constructively)
- Horizontal resonances occur every 4-5 ms at the standard AGS acceleration rate

ML/AI:

Physics informed Learning of the optimal skew quad strength + optimal timing.

Brookhaven National Laboratory Georg.Hoffstaetter@cornell.edu

Reduction of resonance strengths

Parameters to vary:

14 Skew quad amplitudes at each of 80 resonances

Timing of skew quad changes

Observables to optimize:

Polarization after the ramp (2% relative)

Polarization at intermediate energies (2% relative)

C-AD MAC

Activities

Kickoff Collaboration meeting @ Cornell, August 25, 2023 – successful in person Weekly meetings Mondays 3:30pm of all collaborators Interface with weekly meeting Wednesdays 11am on digital twins from Linac to AGS Semi-weekly ML/AI software meeting Friday's on beam & ML computer standards

To be addressed: Potential avenues toward higher proton polarization

- (1) Emittance reduction
- (2) More accurate timing of timed elements
- (3) Reduction of resonance driving terms

C-AD MAC

Dominant Participants

Dominant participants:

BNL: Kevin Brown, Weinin Dai, Bhawin Dhital, Yuan Gao, Kiel Hock, Bohong Huang, Natalie Isenberg, Nguyen Linh, Chuyu Liu, Vincent Schoefer, Nathan Urban

Cornell: Georg Hoffstaetter de Torquat, Lucy Lin, Eiad Hamwi

SLAC: Auralee Edelen

JLAB: Malachi Schram

RPI: Yinan Wang

Radiasoft: Nathan Cook, Jon Edelen, Chris Hall

Teams: (1) Accelerator simulation – digital twins, (2) ML application – code development, (3) Experiment 2 simulation comparison.

Brookhaven National Laboratory Georg.Hoffstaetter@cornell.edu

C-AD MAC

Started Activities

(1) Emittance reduction by linac 2 booster optimization:

- a) Adjust the model to hardware and alignment data for the L2B line
- b) Simulate scraping of beam in the Booster, including ionization foil with Bmad
- c) Write Bmad function that produces loss rate vs. last two L2B correctors and bring to OpenAI Gym format.
- d) Apply established ML codes to this function.
- (2) Emittance reduction by booster optimization
 - a) Compare Bmad to established Zgoubi results and compare to BPM/alignment measurements
 - b) Establish booster-orbit response to corrector changes and produce function that gets minimized by optimizing system parameters, e.g. element alignments, bring into OpenAI gym format.
 - c) Apply established ML codes to this function.

C-AD MAC

Started Activities

- (3) Emittance reduction by B2A transfer:
 - a) Adjust the Bmad model to hardware and alignment data for the B2A line
 - b) Simulate Booster phase space transfer through this line and compare to measured harp profiles

(4) Emittance reduction by re-bucketing

- a) Adapt Bmad bunch-merging code for the EIC's RCS to the Booster (bunch splitting) and AGS (bunch merging)
- b) Compare Bmad to established Python re-bucketing code for Booster and AGS
- c) Write a function that characterizes bunch splitting/merging efficiency from RF parameters for ML/AI optimization.

C-AD MAC

Started Activities

(5) Depolarization reduction by Skew-quad resonance minimization in the AGS:

- a) Detailed Bmad model of the AGS at all energies overcoming:
 - i) Non-symplecticity of tracking through field maps of snakes
 - ii) Introduce differentiable models of snake fields and match these to their field maps
 - iii) Compensate the closed orbit, optics, coupling, and dispersion (esp. vertical) for these maps at all energies
- b) Compute resonance strength of the Bmad model and compare to established results
- c) Compare resonance strength to previous measurements
- d) Define optimized skew-quad compensation schemes at all 82 resonances, minimizing vertical dispersion, coupling, optics errors, and speed of skew-quad changes
- (6) Improved g-gamma meter by combining it's 3 measurements
 - a) Technique discussed, Team being formed

(7) Combined and verified evaluation of existing emittance measurement techniques (through Radiasoft)

a) Technique discussed, Team is formed Georg.Hoffstaetter@cornell.edu C-AD MAC

Optimizers for different applications

Characteristics of involved optimizations

- 1. Optimal parameter settings are hard to find, and the optimum is difficult to maintain.
- 2. The data to optimize on has significant uncertainties.
- 3. Models of the accelerator exist.
- 4. A history of much data is available and can be stored.

Is this type of problem suitable for Machine Learning? Why would ML be better suited than other optimizers and feedbacks?

C-AD MAC

Gaussian Process

- GP model built with scikit-learn library
- A probability distribution over possible functions that fit a set of points
- Mean function + Covariance function

 $f(\mathbf{x}) \sim \mathcal{GP}(m(\mathbf{x}), k(\mathbf{x}, \mathbf{x'}))$

- Kernel: covariance function $k(x_i, x_j)$ of the input variables
- Covariance matrix $K = k(X, X) = \begin{bmatrix} k(x_1, x_1) & \cdots & k(x_1, x_t) \\ \vdots & \ddots & \vdots \\ k(x_t, x_1) & \cdots & k(x_t, x_t) \end{bmatrix}$
- At a sample point x_i , Gaussian process returns mean $\mu(x_i|X) = m(x_i) + k(x_i, X)K^{-1}(f(X) m(X))$ and variance $\sigma^2(x_i|X) = k(x_i, x_i) k(x_i, X)K^{-1}k(X, x_i)$

Georg.Hoffstaetter@cornell.edu

Brookhaven

C-AD MAC

Acquisition Function

- Guide how input space should be explored during optimization
- Combine predicted mean and variance
 from Gaussian Process model
 - Probability Improvement (PI)
 - Expected Improvement (EI)
 - Upper Confidence Bound (UCB)

$$UCB(x) = \mu(x) + \kappa \sigma(x)$$

Brookhaven National Laboratory Georg.Hoffstaetter@cornell.edu

C-AD MAC

Merit of physics-informed optimization

Neural Network System Models + Bayesian Optimization

Combining more expressive models with BO \rightarrow important for scaling up to higher-dimensional tuning problems (more variables)

Good first step from previous work: use neural network system model to provide a prior mean for a GP

Used the LCLS injector surrogate model for prototyping **variables:** solenoid, 2 corrector quads, 6 matching quads **objective:** minimize emittance and matching parameter

Summer '22 undergrad intern Connie Xu

34

Why is Bayesian Optimization suitable?

- 1. The data to optimize on has significant uncertainties
- → No derivatives have to be computed.
- 2. Models of the accelerator exist
- ➔ the expected functional form can be included in the function search (Physics-informed learning)
- 3. A history of much data is available and can be stored
- \rightarrow All past data are included to model the function to be optimized.

C-AD MAC

Summary

- A proposal to DOE-NP has been accepted for the enhancement of proton polarization using ML/AI. Goal: 5%.
- Several accelerator optimizations can impact polarization.
- These topics are of the type suitable for Bayesian Optimization
- Excellent team has formed, items being addressed:
- Emittance reduction (orbit, optics, bunch splitting)
- More accurate timing of quadrupole jumps (G-gamma meter)
- Reduction of resonance driving terms (Horizontal spin matching with skew quads)
