

# Real-seeded tracking – comparison between ACTS v21.1 and v30

Barak Schmookler

# Outline

- EICRecon was recently updated to use ACTS v30. Previously, we were using ACTS v21.1. We want to study what affect, if any, this update has on the real-seeded tracking.
- Simulation summary:
  - Single negative muon generated
  - Uniform eta distribution from  $[-4,4]$
  - Uniform momentum distribution from  $[0.5,20]$  GeV/c
  - Generation vertex:  $(0,0,0)$  mm
  - Same Geant4 (npsim) simulation file was used for both ACTS v30 and ACTS v21.1

# Seed multiplicity

## ACTS v21.1

Number of seeds vs. generated particle  $\eta$

## ACTS v30

Number of seeds vs. generated particle  $\eta$

# Seed efficiency

ACTS loc-a Resolution: (rec. - true)

## ACTS v30

ACTS loc-a Resolution: (rec. - true)

Seed level  
Track level

# Loc-a resolution

At the seed level, ACTS loc-a is always being set positive in our v30 implementation.

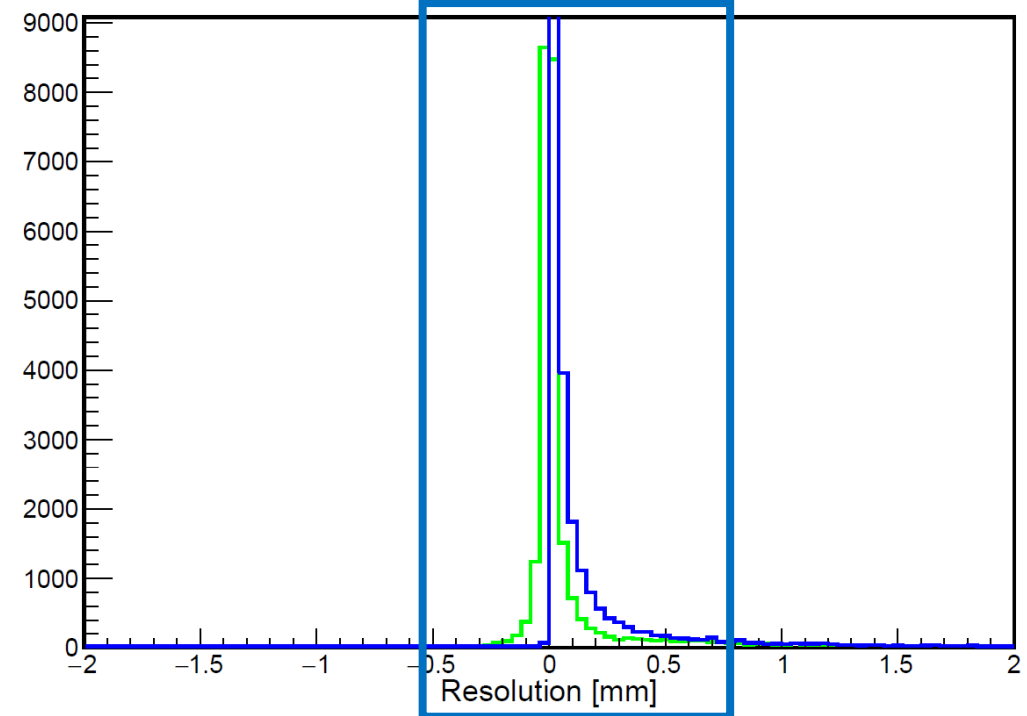

## ACTS v21.1

ACTS loc-a Resolution: (rec. - true)

## ACTS v30

ACTS loc-a Resolution: (rec. - true)

This leads to a bias in the track-level reconstruction

$(v_x, v_y, v_z) = (0, 0, 0)$  mm

$(v_x, v_y, v_z) = (0, 0, +10)$  mm

$(v_x, v_y, v_z) = (0, 0, -10)$  mm

### ACTS v21.1

Real-seeded tracking

### ACTS v30

Real-seeded tracking

Reconstructed z: longitudinal impact parameter with respect to (0,0,0)

Reconstructed transverse DCA: signed transverse impact parameter with respect to (0,0,0)

## Cause of this issue

- In our EICRecon seeding code, we call the *globalToLocal* function. If this function is successful, then it is used to set the ACTS loc-a and loc-b values.
- If it fails, however, ACTS loc-a and loc-b are set by hand. In this case, ACTS loc-a gets (incorrectly) always set as a positive number.
- In ACTS v21.1, the call to the *globalToLocal* function would usually work successfully; but in ACTS v30, it is almost always failing.

```
207     const float z0 = seed.z();
208     auto perigee = Acts::Surface::makeShared<Acts::PerigeeSurface>(Acts::Vector3(0,0,0));
209     Acts::Vector3 global(xypos.first, xypos.second, z0);
210
211     auto local = perigee->globalToLocal(m_geoSvc->getActsGeometryContext(),
212                                       global, Acts::Vector3(1,1,1));
213
214     Acts::Vector2 localpos(sqrt(square(xypos.first) + square(xypos.second)), z0);
215     if(local.ok())
216     {
217         localpos = local.value();
218     }
```

<https://github.com/eic/EICrecon/blob/main/src/algorithms/tracking/TrackSeeding.cc>

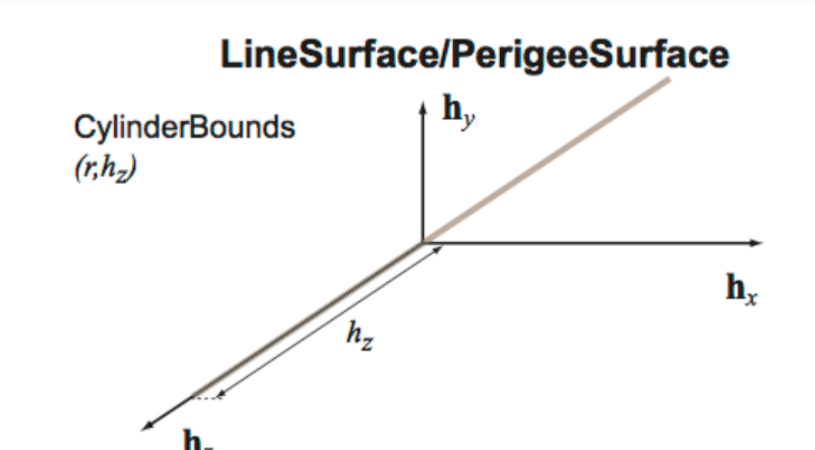

# Cause of this issue

## Line surface

`Acts::LineSurface` is a special kind of surface that depends on a reference direction, typically the unit momentum direction  $\vec{d}$  of a particle. A point in space is considered *on surface* if and only if it coincides with the point of closest approach between the direction vector  $\vec{d}$  and the line direction vector  $\vec{z}$ . As such, the function `Acts::LineSurface::globalToLocal()` can fail, if the argument position and direction do not fulfill this criterion. It is pure-virtual, meaning that it can not be instantiated on its own.

```
class LineSurface : public Acts::Surface
```

Base class for a linear surfaces in the TrackingGeometry to describe dirft tube, straw like detectors or the Perigee It inherits from Surface.

<https://acts.readthedocs.io/en/latest/core/geometry/surfaces.html#line-surface>

12/7/2023

Passing in a constant vector is clearly wrong – we should pass in the seed momentum vector that we reconstructed. My guess is that in ACTS v21.1, for a particle generated at  $(x,y) = (0,0)$ , the tolerance was set large enough that this was not an issue. But it has become one in ACTS v30. It was always an issue for off-beamline particles, so it should be fixed in any case.

```
207     const float z0 = seed.z();
208     auto perigee = Acts::Surface::makeShared<Acts::PerigeeSurface>(Acts::Vector3(0,0,0));
209     Acts::Vector3 global(xypos.first, xypos.second, z0);
210
211     auto local = perigee->globalToLocal(m_geoSvc->getActsGeometryContext(),
212                                       global, Acts::Vector3(1,1,1));
213
214     Acts::Vector2 localpos(sqrt(square(xypos.first) + square(xypos.second)), z0);
215     if(local.ok())
216     {
217         localpos = local.value();
218     }
```

15

## Version comparison summary

- Other than for ACTS Loc-a, the seeding results and the resultant tracking with these seeds is very stable.
- The issue with the reconstruction of ACTS Loc-a seems to be more an issue with how we are calling the *globalToLocal* function in our EICRecon track seeding code. Jeetendra Gupta and I are working to implement and test the fix.

## Another (not version related) issue

If we generate a negative muon from

$$(x,y,z) = (10,0,0) \text{ mm}$$

with a momentum direction of

$$(p_x, p_y, p_z) = \{+\cos(10^\circ), +\sin(10^\circ), 0\},$$

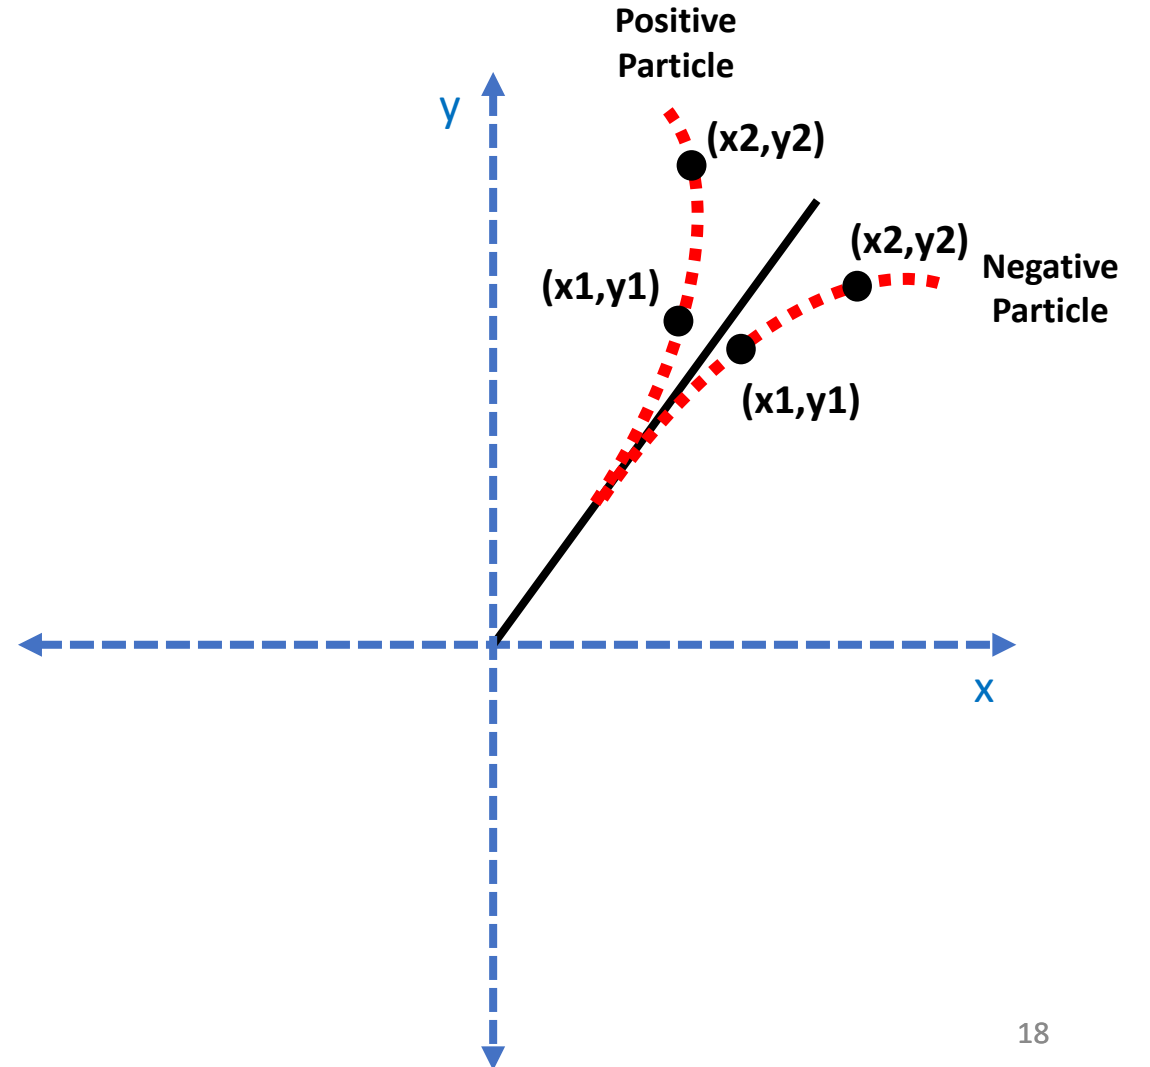

we see the seed charge reconstructed as positive. This causes the seed phi to be wrong and the track reconstruction to fail.

[https://github.com/eic/EICrecon/tree/seed\\_charge](https://github.com/eic/EICrecon/tree/seed_charge)

May be better to use matrix methods to determine charge:

# Another (not version related) issue

Check sign of  $\begin{vmatrix} x1 & y1 & 1 \\ x2 & y2 & 1 \\ x3 & y3 & 1 \end{vmatrix}$

```
250 int eicrecon::TrackSeeding::determineCharge(std::vector<std::pair<float,float>>& positions) const
251 {
252     // determine the charge by the bend angle of the first two hits

261     if(dphi < -M_PI) dphi = 2*M_PI + dphi;
262     if(dphi < 0) charge = -1;
263
264     return charge;
265 }
```

<https://github.com/eic/EICrecon/blob/main/src/algorithms/tracking/TrackSeeding.cc>

## Seed charge summary

- Issue exists with seed charge calculation when particle is generated off the beamline. This affects tracking downstream.
- Implemented a simple fix in an EICRecon branch. Considering trying some other methods.
- Jeetendra and I will perform some more detailed studies before submitting a PR.
