

As we discussed last week, it seemed reasonable to several of us to join multiple tracking-related meetings;

- Track reconstruction meeting,
- Vertexing meeting,
- Restart of tracking working group meeting after ANL

Tracking working group meeting seemed the preferred "slot."

So, we will proceed with weekly meetings. As the need arises, there may be some time-blocks — e.g. associated with the software, DSCs etc. — or themed meetings.

This week: two updates on software status and another attempt towards figures for the TDR.

As you may know, there was a 1-day workshop on Inner Detector Support Structures and Cooling earlier this week. This may warrant follow up from within this group, almost certainly towards a more realistic detector description in simulations but possibly also in terms of feedback on trade-offs in active areas. Consensus among several of us was to hold off for this week's agenda and return to this as part of next week's tracking WG agenda.
