

# Covariance error matrix

Jeetendra Gupta  
Barak Schmookler

```
Particle generated: negative muon
Eta range : -4 to 4
P range: 0.5 to 20 GeV/c
# of events: 10000
Vertex: (0,0,0) mm
```

## Topic of study:

```
trackparam.setLocError({0.1,0.1}); //covariance of location
trackparam.setMomentumError({0.05,0.05,0.05}); // covariance on theta/phi/q/p
trackparam.setTimeError(0.1); // error on time
```

These are the errors we currently set on the initial track parameters that go into the CKF from the seeder.

These values should be guided by the parameter resolutions *at the seed level*, and the effects of adjusting these parameters should be studied. We want to find the 'sweet spot' for these values.

Ongoing work: how does initial error matrix affect our tracking?

### Parameters Covariance matrix

$$C = \begin{bmatrix} \sigma^2(l_0) & \text{cov}(l_0, l_1) & \text{cov}(l_0, \phi) & \text{cov}(l_0, \theta) & \text{cov}(l_0, q/p) \\ \cdot & \sigma^2(l_1) & \text{cov}(l_1, \phi) & \text{cov}(l_1, \theta) & \text{cov}(l_1, q/p) \\ \cdot & \cdot & \sigma^2(\phi) & \text{cov}(\phi, \theta) & \text{cov}(\phi, q/p) \\ \cdot & \cdot & \cdot & \sigma^2(\theta) & \text{cov}(\theta, q/p) \\ \cdot & \cdot & \cdot & \cdot & \sigma^2(q/p) \end{bmatrix}$$

### Hit residual and chi-square

$$\text{Res} = \vec{x}_{\text{calibrated}} - \mathbf{H}\vec{x}_{\text{predicted}}$$

$$\chi^2 = \text{Res}^T (\mathbf{C}_{\text{calibrated}} + \mathbf{H}\mathbf{C}_{\text{predicted}}\mathbf{H}^T)^{-1} \text{Res}$$

### Evolution of parameters covariance

$$C^f = J \cdot C^i \cdot J^T,$$

$$J = \begin{bmatrix} \frac{\partial l_0^f}{\partial l_0^i} & \cdots & \frac{\partial l_0^f}{\partial (q/p)^i} \\ \vdots & \ddots & \vdots \\ \frac{\partial (q/p)^f}{\partial l_0^i} & \cdots & \frac{\partial (q/p)^f}{\partial (q/p)^i} \end{bmatrix},$$

H is observation matrix

$\mathbf{C}_{\text{calibrated}}$  is measurement covariance

$\mathbf{C}_{\text{predicted}}$  is predicted estimate covariance

## Loc Error

```
trackparam.setLocError({0.1,0.1}); //covariance of location  
trackparam.setMomentumError({0.05,0.05,0.05}); // covariance on theta/phi/q/p  
trackparam.setTimeError(0.1); // error on time
```

# # Wrong charge after CKF

# of wrong charge for unique real seeding after CKF decreases exponentially as we increase loc Error

wrong charge after ckf vs loc Error

Total real seed after ckf = 27734  
Unique real seed after ck ~ (9000,10000)  
-Unique if two seeds' phi and theta  
difference is more than 2 mrad

# Loc b resolution

Loc b resolution is almost the same as we increase loc Error

mean loc b res vs. loc error for green curve (post ckf)

## Revisiting Loc b resolution for loc 0.1 and 1.50 for a better view

Loc b for real seeding after ckf remains symmetric for both loc 0.1 and 1.5

# Loc a resolution

Loc a resolution becomes more symmetric as we increase loc Error

mean loc a res vs. loc error for green curve (post ckf)

# Revisiting Loc a resolution for loc 0.1 and 1.5 for a better view

We observe an asymmetry in real seeding after ckf (green curve) for loc 0.1

ACTS loc-a r

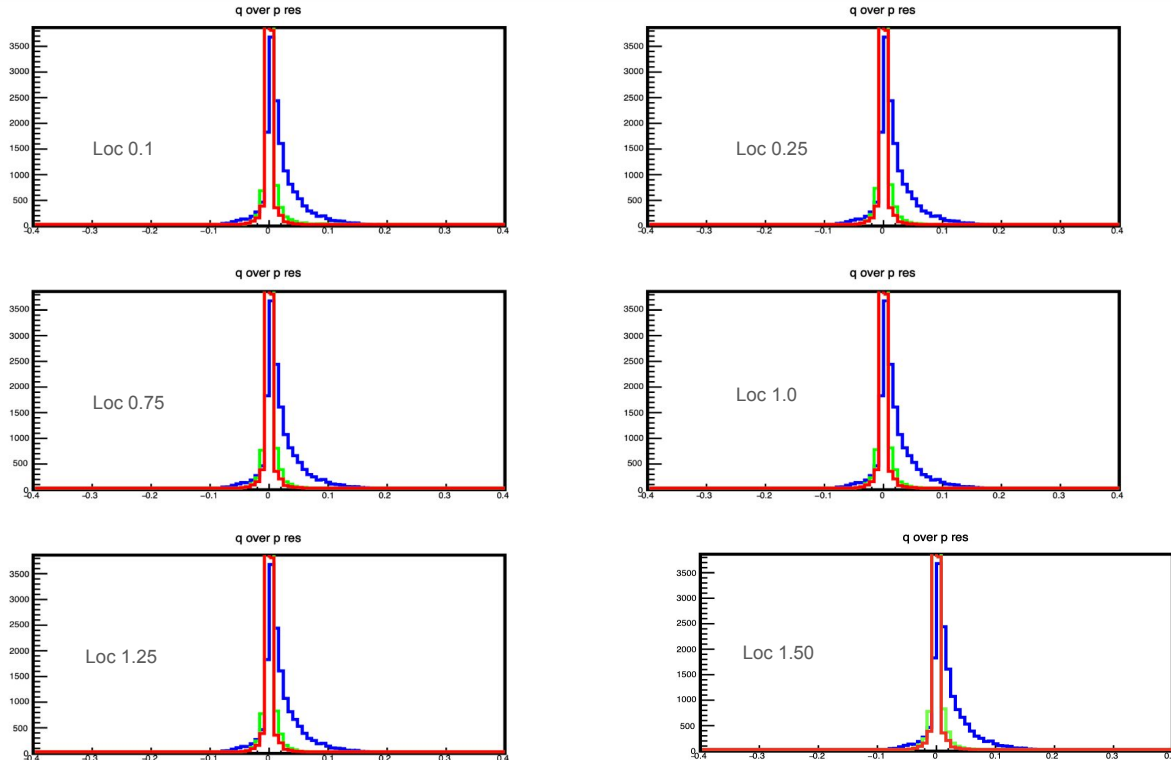

ACTS loc-a r

# q/p resolution

q/p resolution becomes more symmetric as we increase loc a error

mean q/p res vs loc Error for green curve (post ckf)

# # of unique tracks (angle cut 2 mrad)

# of 1 unique track increases as we increase loc error for real seeding after ckf

Loc 0.1

Loc 0.25

Loc 0.75

Loc 1.0

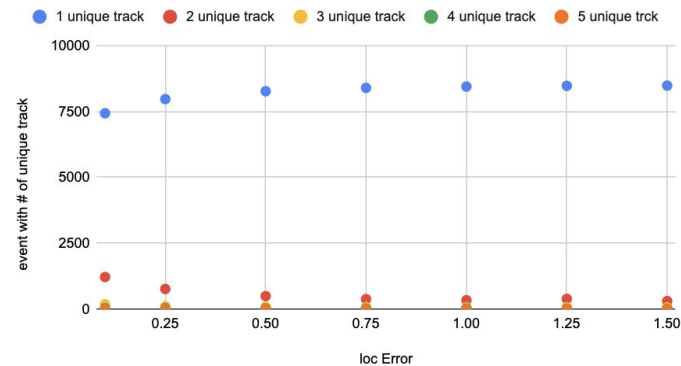

Loc 1.25

Loc 1.50

- Unique if two seeds' phi and theta difference is more than 2 mrad
- We throw away duplicate tracks
- increasing the loc (a,b) error reconstructs the duplicate tracks closer, so that we find more of one unique track instead of two unique tracks

events with # of unique track vs loc Error for (post ckf)

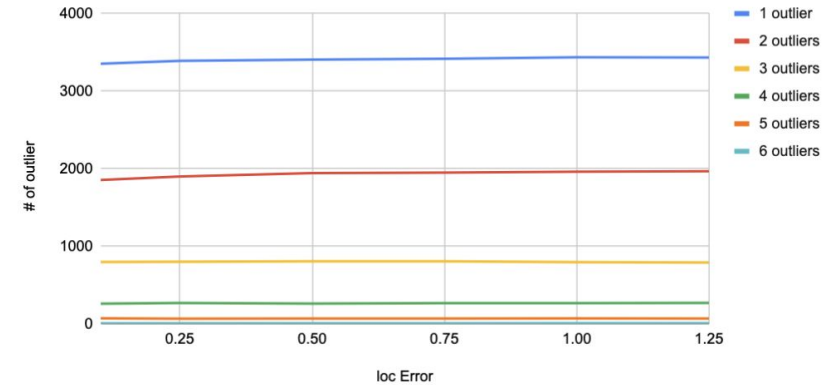

# # of measurements, outliers, holes for real seeding after ckf

# of measurements vs loc Error

# of outliers vs loc Error

# of holes vs loc Error

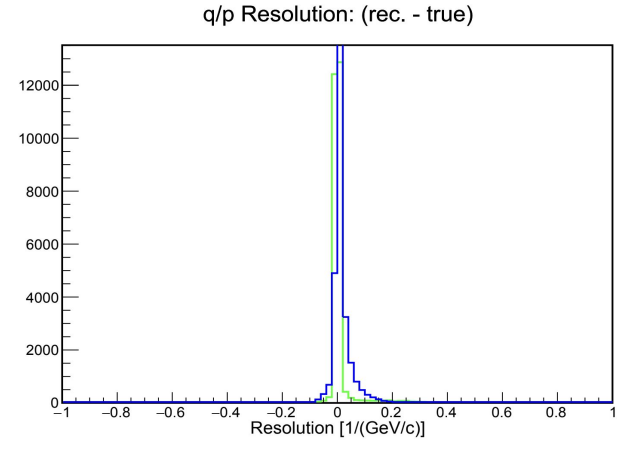

## qOverp Error

```
trackparam.setLocError({0.1,0.1}); //covariance of location  
trackparam.setMomentumError({0.05,0.05,0.05}); // covariance on theta/phi/q/p  
trackparam.setTimeError(0.1); // error on time
```

# Summary

We observe better results as we increase loc (a,b) Errors

- We think a value between 1.0 to 1.5 would be good

We do not observe a huge change as we change q/p error, however there are some subtle differences

- We see improvement in data as we increase q/p error from 0.005 to 0.025, and after that, we see a very slow degradation in data
- A value around 0.025 looks good

As of now:

We have a new branch on EICrecon #1300 dedicated to the study of this cov error matrix

<https://github.com/eic/EICrecon/issues/1300>

These error values are hardcoded as of now. We propose to put them in a configuration file, so that we can change it on terminal and do more study!

[EICrecon/src/algorithms/tracking/TrackSeeding.cc](#)

Current Implementation:

```
edm4eic::Cov6f cov;
cov(0,0) = 0.1; // loc0
cov(1,1) = 0.1; // loc1
cov(2,2) = 0.05; // theta
cov(3,3) = 0.05; // phi
cov(4,4) = 0.05; // qOverP
cov(5,5) = 0.1; // time
trackparam.setCovariance(cov);
```

Our proposal:

```
edm4eic::Cov6f cov;
cov(0,0) = m_cfg.m_Loc_a_Error;
cov(1,1) = m_cfg.m_Loc_b_Error;
cov(2,2) = m_cfg.m_theta_Error;
cov(3,3) = m_cfg.m_phi_Error; //
cov(4,4) = m_cfg.m_qOverp_Error;
cov(5,5) = m_cfg.m_time_Error; /
trackparam.setCovariance(cov);
```

[EICrecon/src/algorithms/tracking/OrthogonalTrackSeedingConfig.h](#)

```
//// Error calculations
float m_Loc_a_Error = 0.1; //Error on Loc a
float m_Loc_b_Error = 0.1; //Error on Loc b
float m_theta_Error = 0.05; //Error on theta
float m_phi_Error = 0.05; //Error on phi
float m_qOverp_Error = 0.05; //Error on q over p
float m_time_Error = 0.1; //Error on time
```

Next: We also need to add these configurations in TrackSeeding\_Factory.h

[EICrecon/src/global/tracking/TrackSeeding\\_Factory.h](#)

```
ParameterRef<float> m_Loc_a_Error {this, "Loc_a_Error", config().m_Loc_a_Error, "Error on Loc a for Acts::OrthogonalSeedFinder"};  
ParameterRef<float> m_Loc_b_Error {this, "Loc_b_Error", config().m_Loc_b_Error, "Error on Loc b for Acts::OrthogonalSeedFinder"};  
ParameterRef<float> m_theta_Error {this, "theta_Error", config().m_theta_Error, "Error on theta for Acts::OrthogonalSeedFinder"};  
ParameterRef<float> m_phi_Error {this, "phi_Error", config().m_phi_Error, "Error on phi for Acts::OrthogonalSeedFinder"};  
ParameterRef<float> m_qOverp_Error {this, "qOverp_Error", config().m_qOverp_Error, "Error on q over p for Acts::OrthogonalSeedFinder"};  
ParameterRef<float> m_time_Error {this, "time_Error", config().m_time_Error, "Error on time for Acts::OrthogonalSeedFinder"};
```

An example of how we can change these numbers on terminal and do our study

```
eicrecon -Ppodio:output_file=eicrecon_out_0_0_0testing.root -Pdd4hep:xml_files=epic_craterlake.xml -Pjana:nevents=10  
-Ptracking:CentralTrackSeedingResults:qOverp_Error=0.03 -Ptracking:CentralTrackSeedingResults:Loc_a_Error=1  
-Ptracking:CentralTrackSeedingResults:Loc_b_Error=1 output_0_0_0_10events.edm4hep.root
```

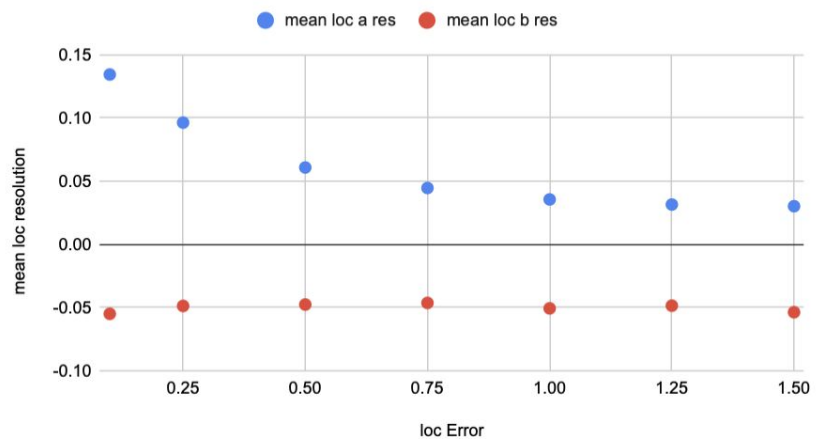

**Next step:**

to study phi error and theta error

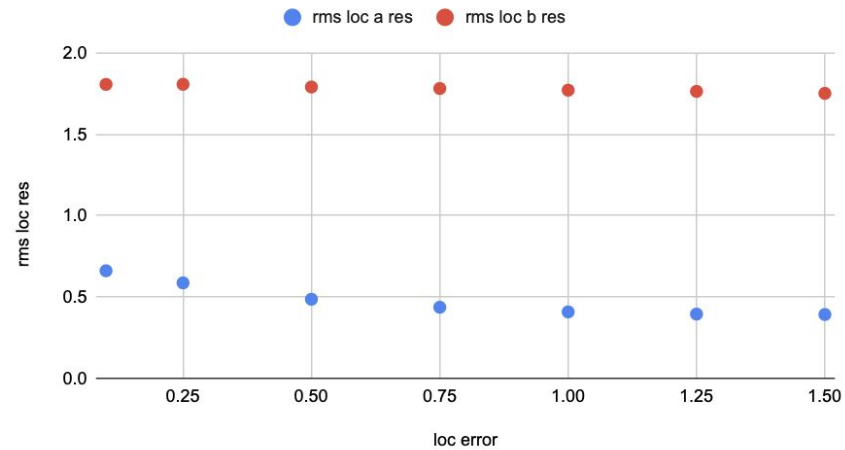

Thank you!
