

EEEMCal gap and background studies

Dmitry Kalinkin

March 1st, 2024

News

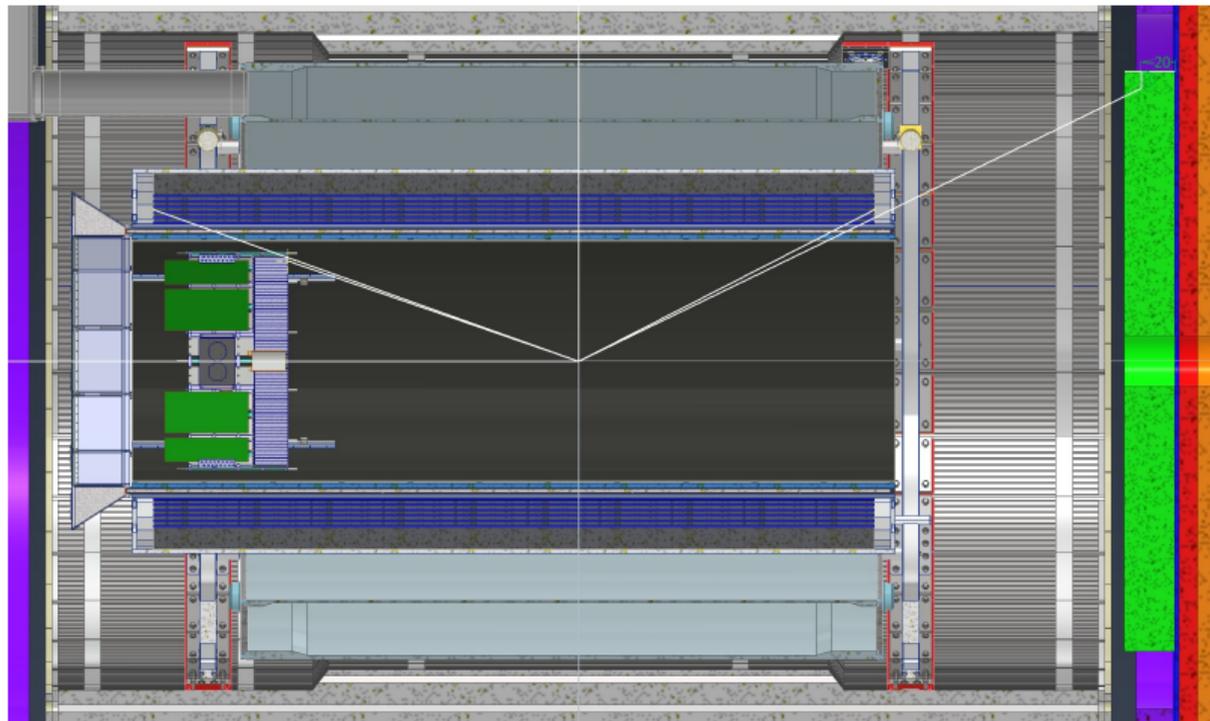

- ▶ The gap study published as benchmark https://github.com/eic/detector_benchmarks/pull/13
- ▶ Barrel ECal length adjustment <https://github.com/eic/epic/pull/648>
- ▶ New study by Jakub on electron beam gas rates featuring updated MC simulation:

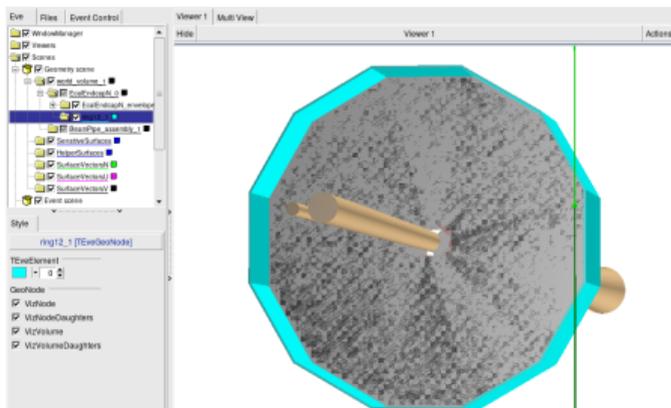

(rates given per detector)

Gap

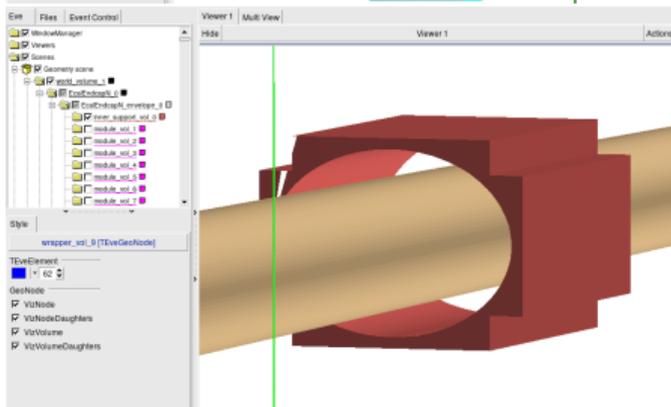

EMCAL Coverage

Simulation geometry (as of 24.02)

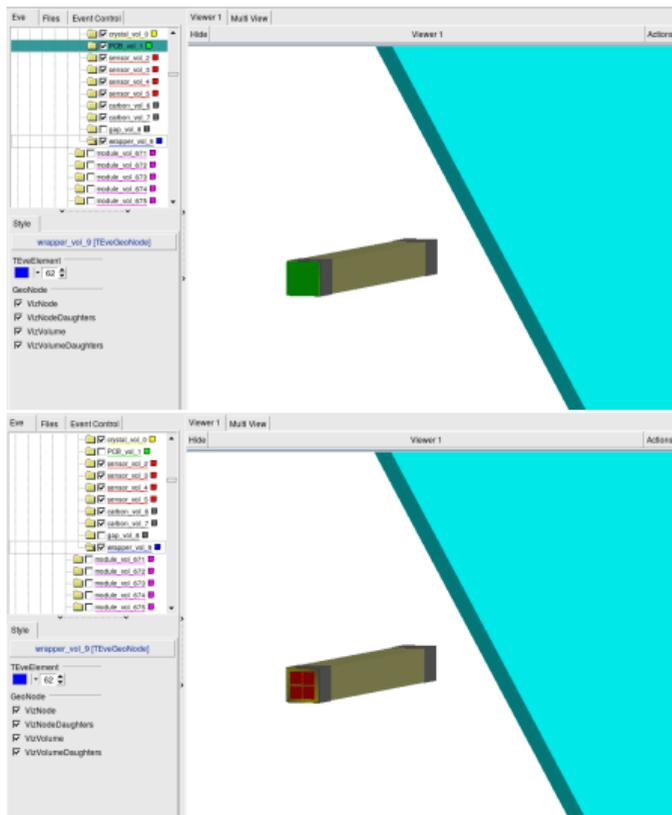

- ▶ “ring12” (cyan) – 0.9 cm thick StainlessSteel
- ▶ “EcalEndcapN_envelope” (grey) – StainlessSteel (only applies where children volumes don't override)

- ▶ “Inner_support_vol” (rust) – Copper
- ▶ modules (black) – Vacuum (only applies where children volumes don't override)

Simulation geometry (as of 24.02)

▶ Air gap volume manually placed around each crystal with the same thickness as carbon fiber (0.2 mm)

Remove aluminum supports

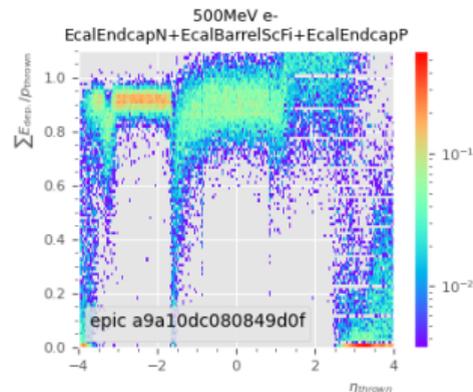

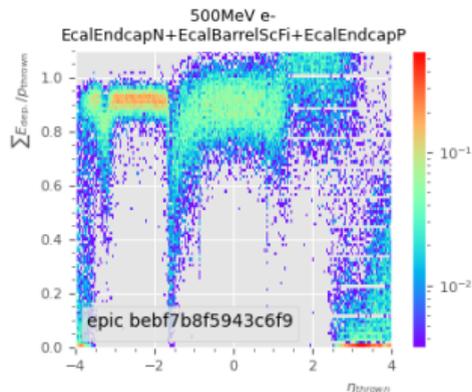

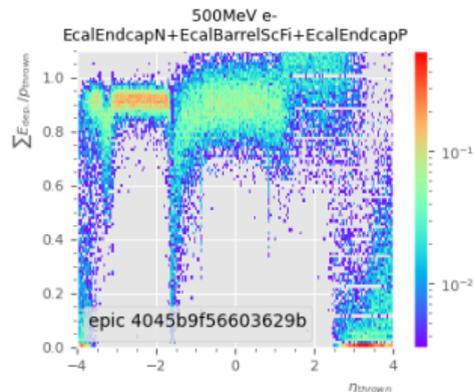

```

Background embedding

First look with clustering

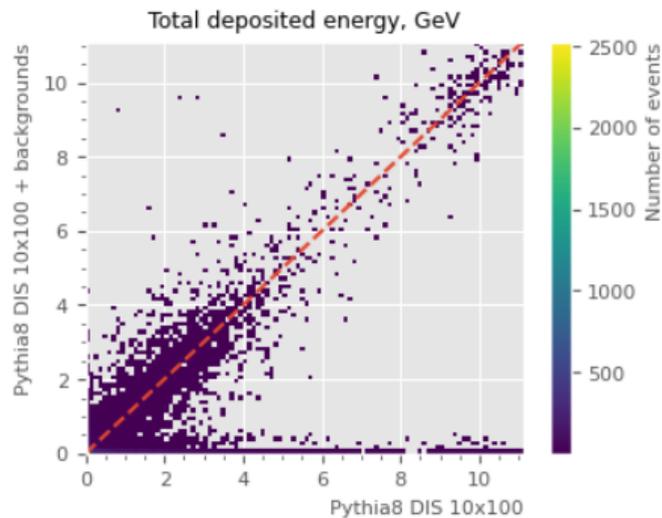

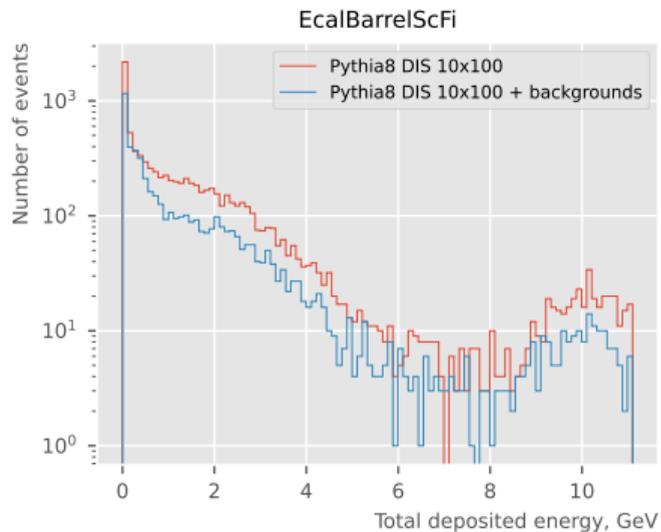

Result from 2 weeks ago

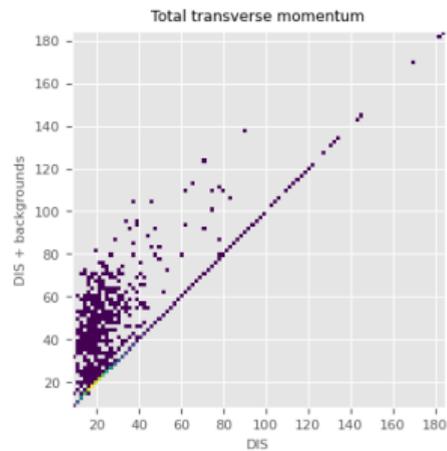

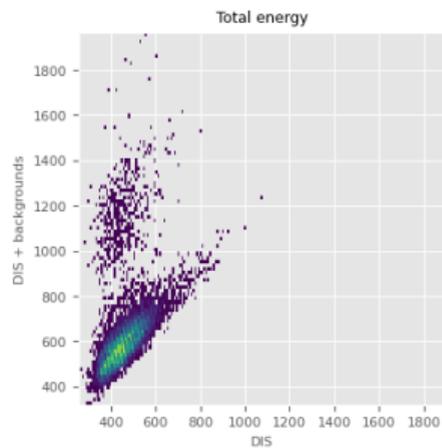

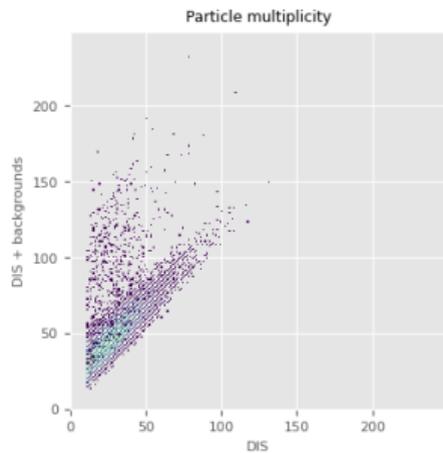

Look without clustering (Backwards ECal)

Look without clustering (Barrel ECal)

Look at HepMC

Looks fine!
