

# Beam Test of the ZDC EMCal Prototype with LYSO+SiPM

Wen-Chen Chang, Kai-Yu Cheng, Tatsuya Chujo, Yuji Goto, Chia-Yu Hsieh, Motoi Inaba, Subaru Ito, Kentaro Kawade, Yongsun Kim, Chia-Ming Kuo, Chih-Hsun Lin, Po-Ju Lin, Rong-Shyang Lu, Jen-Chieh Peng

# Comparison of various crystals

	$X_0$	LY (ph/MeV)	T dep. of LY (%/K)	Decay time (ns)	$\lambda_{em}$ nm
PbWO <sub>4</sub> (CMS)	0.89 cm	200	-1.98	5 (73%) 14 (23%) 110 (4%)	420
LYSO	1.14 cm	30,000 (market standard)	-0.28	36	420
GAGG	1.59 cm	40,000 - 60,000		50 - 150	520
SciGlass	2.4-2.8 cm	>100		22 - 400	440-460

# ZDC ECAL Prototype with LYSO Crystals

8x8 LYSO  
crystal array

LYSO calorimeter  
prototype

8x8 SiPM array

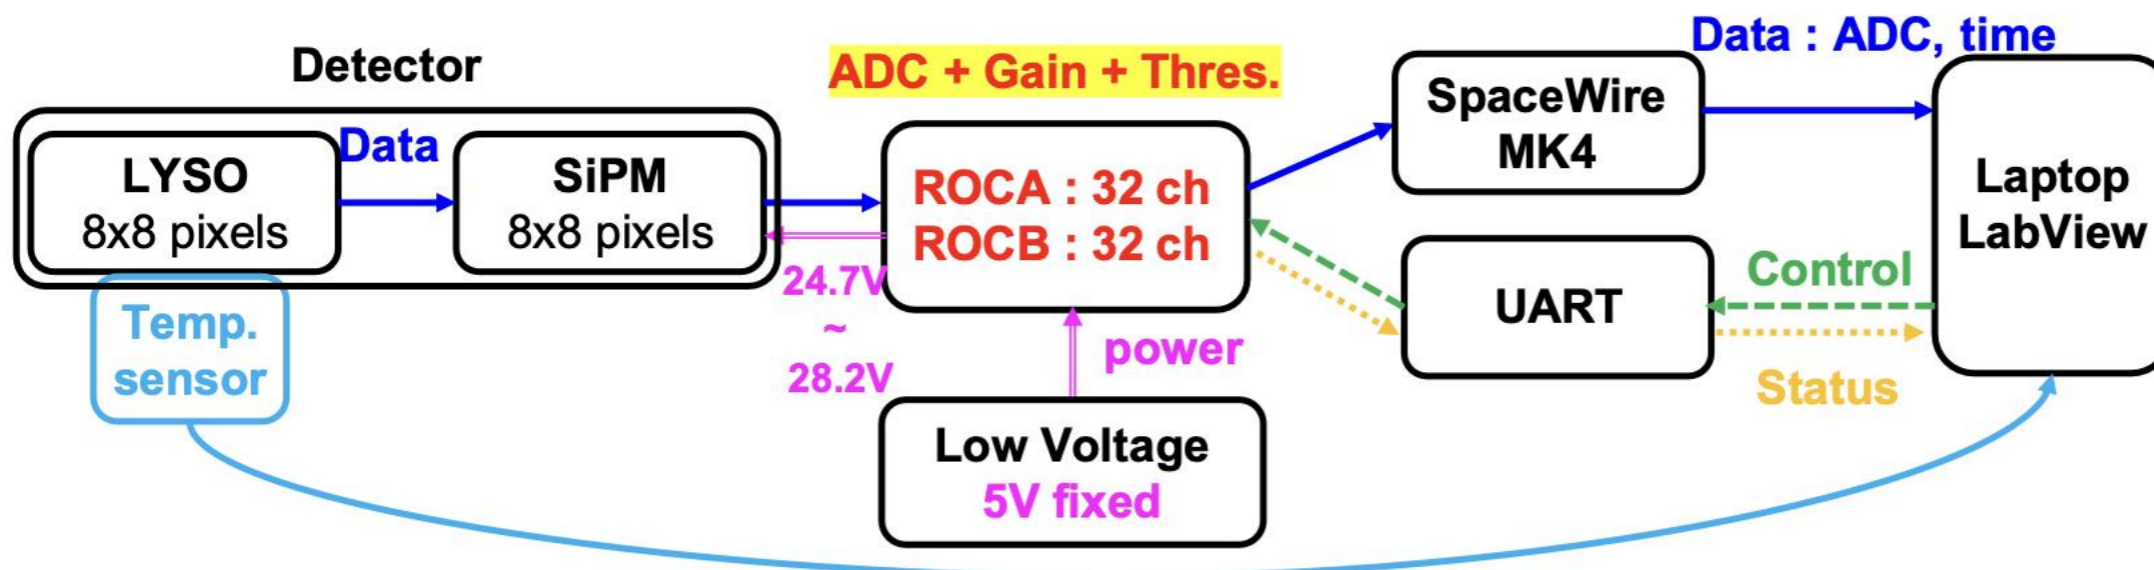

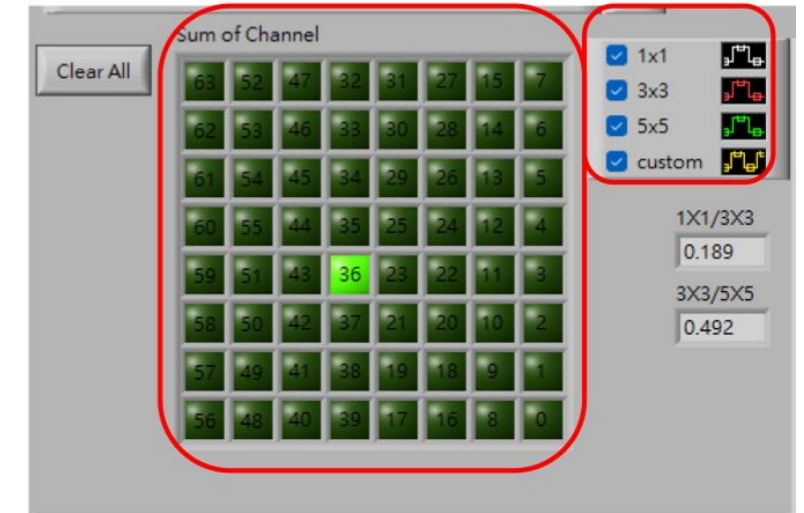

One crystal: 7.12 mm x 7.12 mm x 88.3 mm  
8x8 array: 56.96 mm x 56.96 mm

# Readout for the ZDC ECAL Prototype with LYSO Crystals

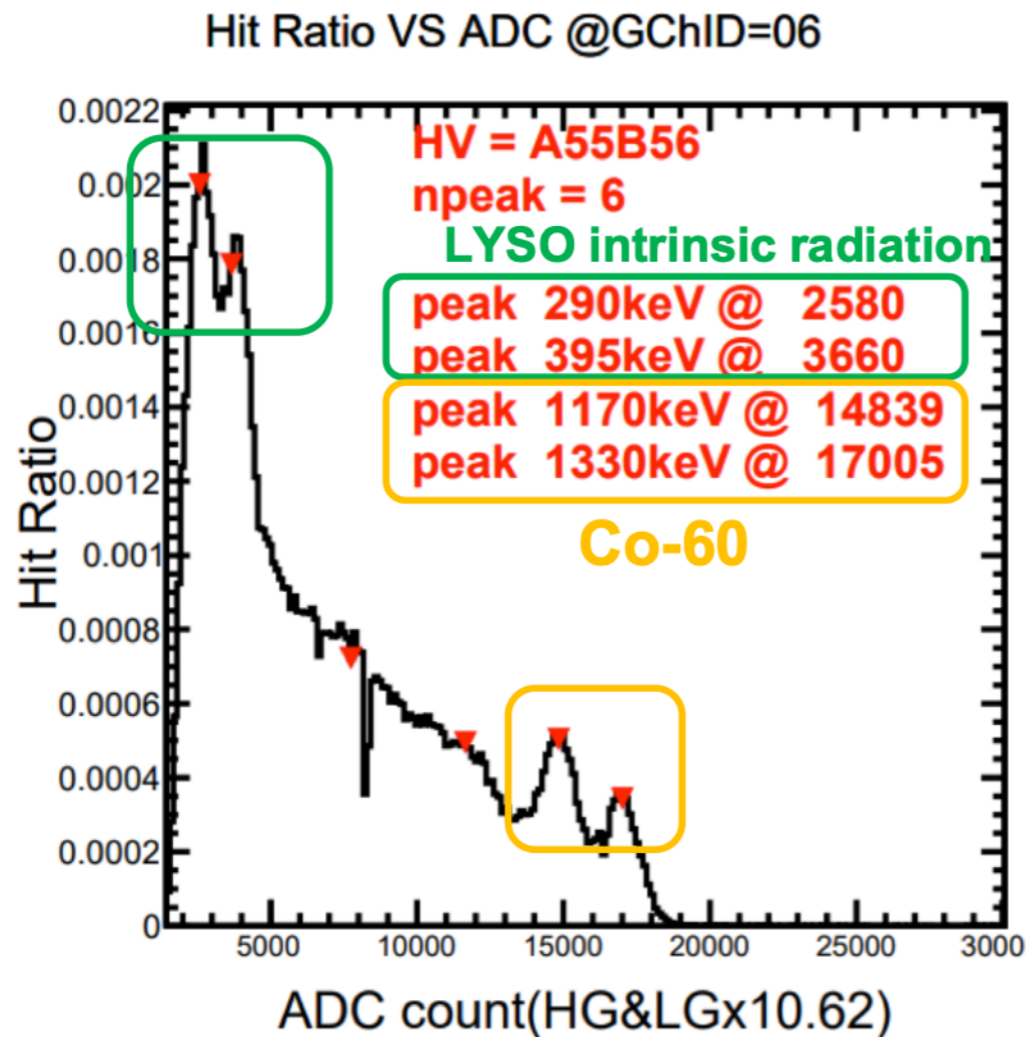

- Designed by **Chih-Hsun Lin** of Academia Sinica
- 64 channels
- Trigger:
  - Self-triggered
  - Can accept external timing signal → needs to be studied
  - May accept external trigger → needs to be studied

# Test Setup

# Tests with Co-60

**We use Co-60 and LYSO intrinsic radiation to calibrate the detector.**

- **@HV = 27.00V**
    - 1.330 MeV @ 17005 digit
    - 1.330 MeV / 17005 digit ~ 7.8e-5 MeV / digit
- Saturated digit = 11, 0000 digit

→ **Saturated at 8.6MeV**  
**This HV/gain is too high for our beam test condition.**

- HV setting range = 24.7V to 28.2V

# Why SiPM?

- Available readout board with CITIROC1A from wee roc for multichannel SiPM (Chih-Hsun Li, Academia Sinica) → can be used for first prototype study
- Need a suitable photodetector for critical fluence value ( $10^{14}/cm^2$ )
  - CMS ECAL
    - barrel: APD, up to  $4 \times 10^{13}/cm^2$ , gain: 1 - 100
    - endcap: VPT (vacuum phototriodes), up to  $7 \times 10^{15}/cm^2$
  - CMS MTD BTL (LYSO tiles with SiPM readout)
    - radiation (4/ab):  $2 \times 10^{14}/cm^2$ , gain:  $2 \times 10^5$

# SiPM Performance vs Number of Photons

- Need the fraction of fired microcells of a SiPM below 70% for a linear response
- Number of microcells in currently used SiPM: 18,980
  - the one from HPK used by CMS BTL has 40,000 microcells
- LYSO light yield for 500MeV energy deposit:  $500\text{MeV} \times 40,000 \text{ photons/MeV} \times 0.2$  (photon detection efficiency)  $\times 0.25$  (light collection efficiency) = 1,000,000 photons

# Beam Test @ ELPH

- A beam test with positrons was conducted at the ELPH, Tohoku University, between **15 to 21 February 2024**
- Beam time: ~36 hours (**19 to 21 February 2024**)
- Beam energy: 47.18 MeV up to 823.26 MeV
- Rate: 1,000 - 3,000 Hz
- Participants: RIKEN, Tsukuba University, Tsukuba University of Technology, Sejong University, EIC-Taiwan

# Beam Test @ ELPH

# Run list

	Run range	Source/Beam	Purpose
<b>HV Scan</b>	1 - 20	Co60 (1 - 6, 20) Na22 (7 - 19)	Verify gains
<b>“Background”</b>	21 - 33	Intrinsic radiation	Understand instrinsic radiation rate with threshold cuts
<b>Gain Calibration</b>	33 - 36	Na22 (34 - 37)	Calibrate each channel
<b>HV and Beam Energy Scan</b>	41 - 99	Beam (47 - 823 MeV)	Understand detector performance and study energy resolution and shower shapes
<b>Position Scan</b>	101 - 129	Beam (197 MeV)	
<b>HV and Beam Energy Scan at Low Energy</b>	129 - 157	Beam (< 297 MeV)	
<b>With Absorbers</b>	160 - 225	Beam (197 - 823 MeV)	
<b>Rotation</b>	227 - 238	Beam (98, 197, 297 MeV)	Understand detector performance

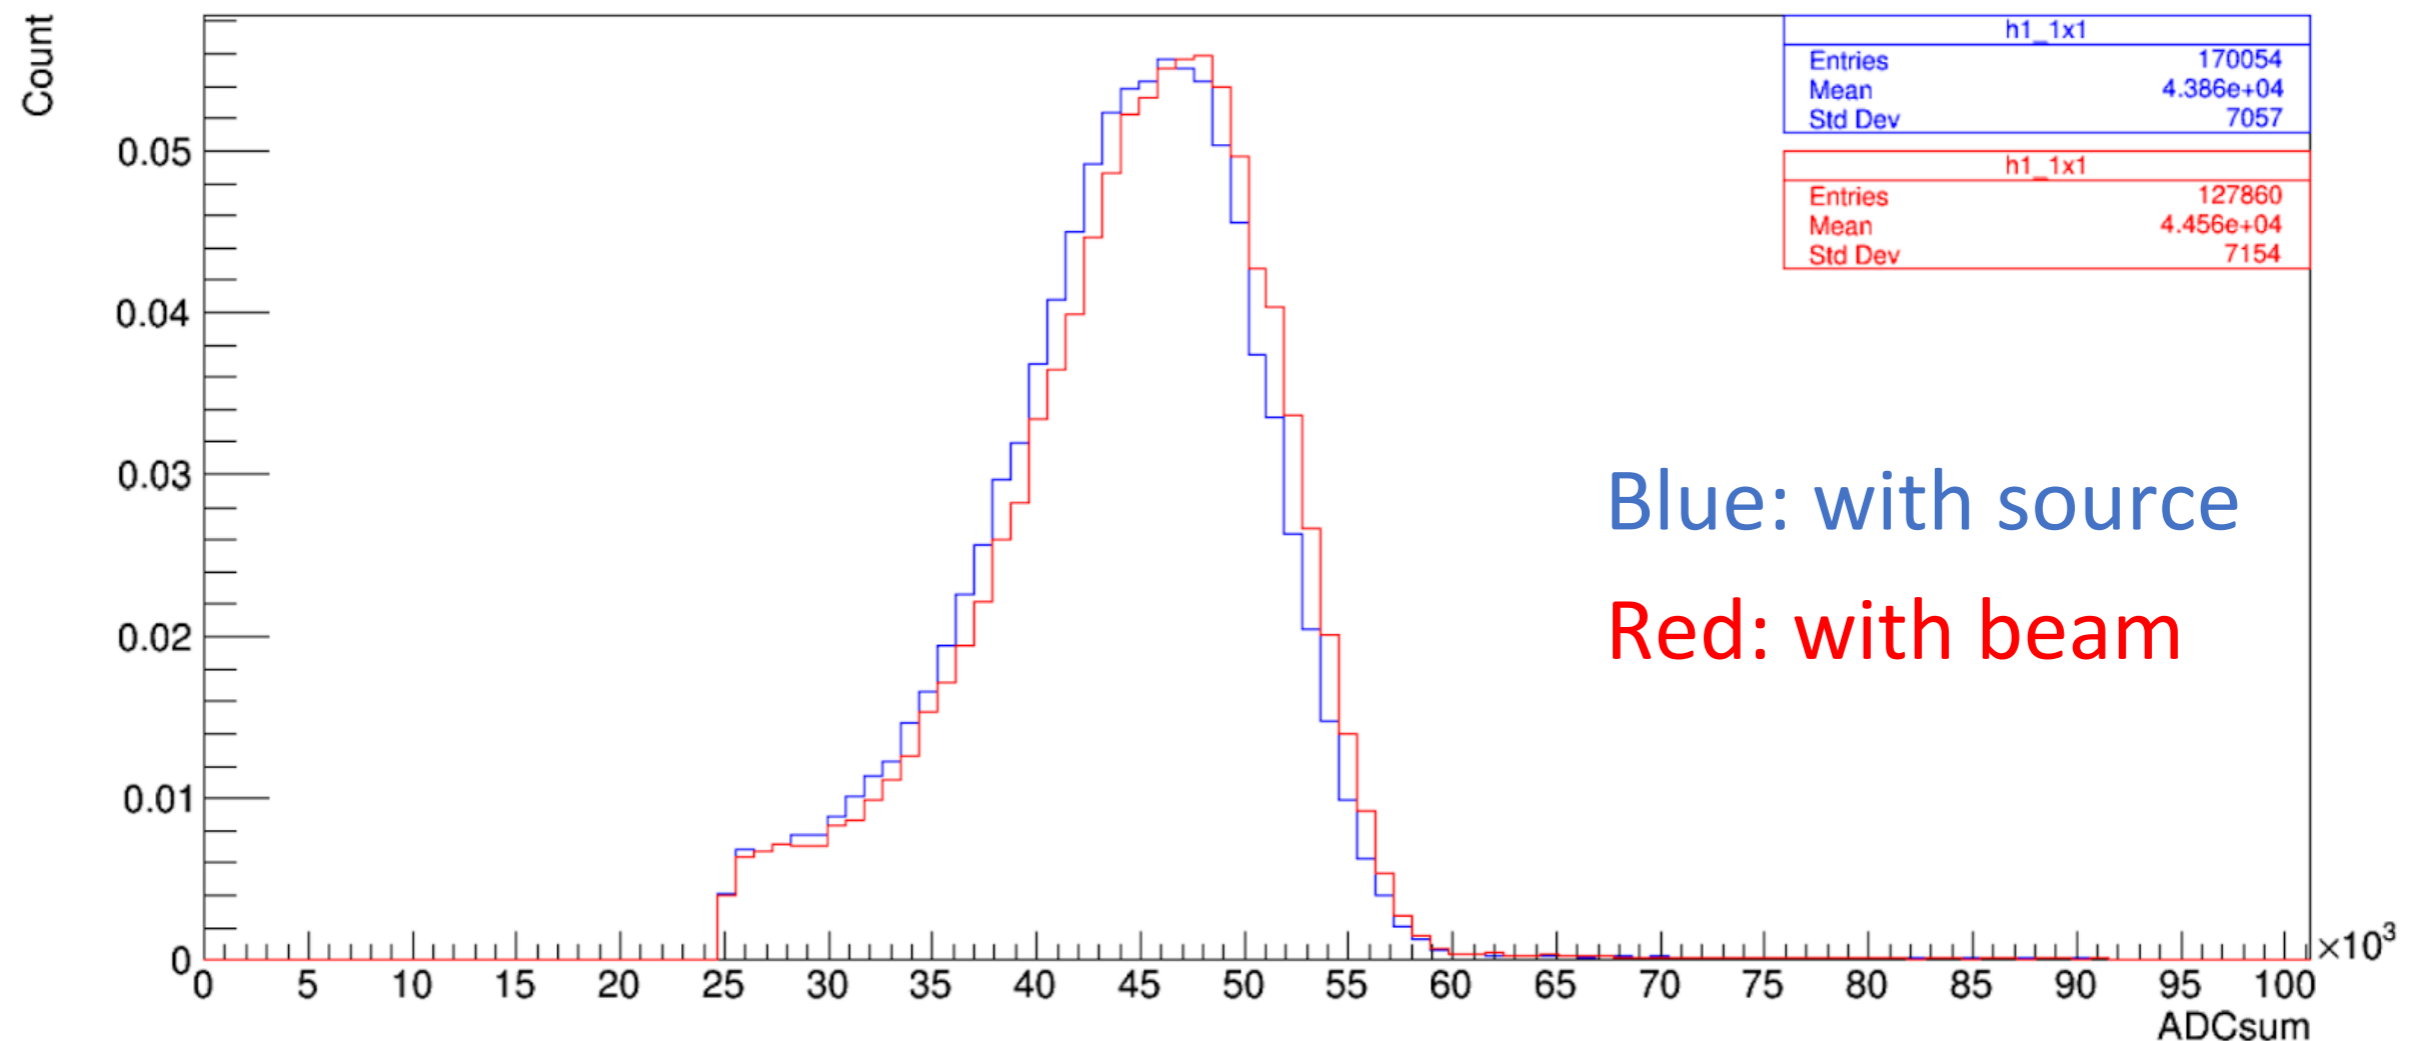

# Clustering

# Items to be studied

- Detector performance
- Comparison between data and simulation
- $E_{\max}$  VS  $E_{\text{beam}}$  at different SiPM HVs
- Hit multiplicity
- Energy spectra ( $E_{\max}$ ,  $E_{3 \times 3}$ ,  $E_{5 \times 5}$ )
- Shower shapes ( $E_{\max}/E_{5 \times 5}$ ,  $E_{3 \times 3}/E_{5 \times 5}$ ,  $E_{\max}/E_{3 \times 3}$ ,  $E_{2 \times 5}/E_{5 \times 5}$ ,  $\sigma_X$ ,  $\sigma_Y$ , ...)
- Beam profile
- Energy resolution as a function of beam energy

# Channel-by-Channel Gain Calibration

- Channel-by-channel gain calibration was performed using radiation source and beam, respectively
- The calibration obtained with the radiation source is not significantly different from the one obtained with high energy beam

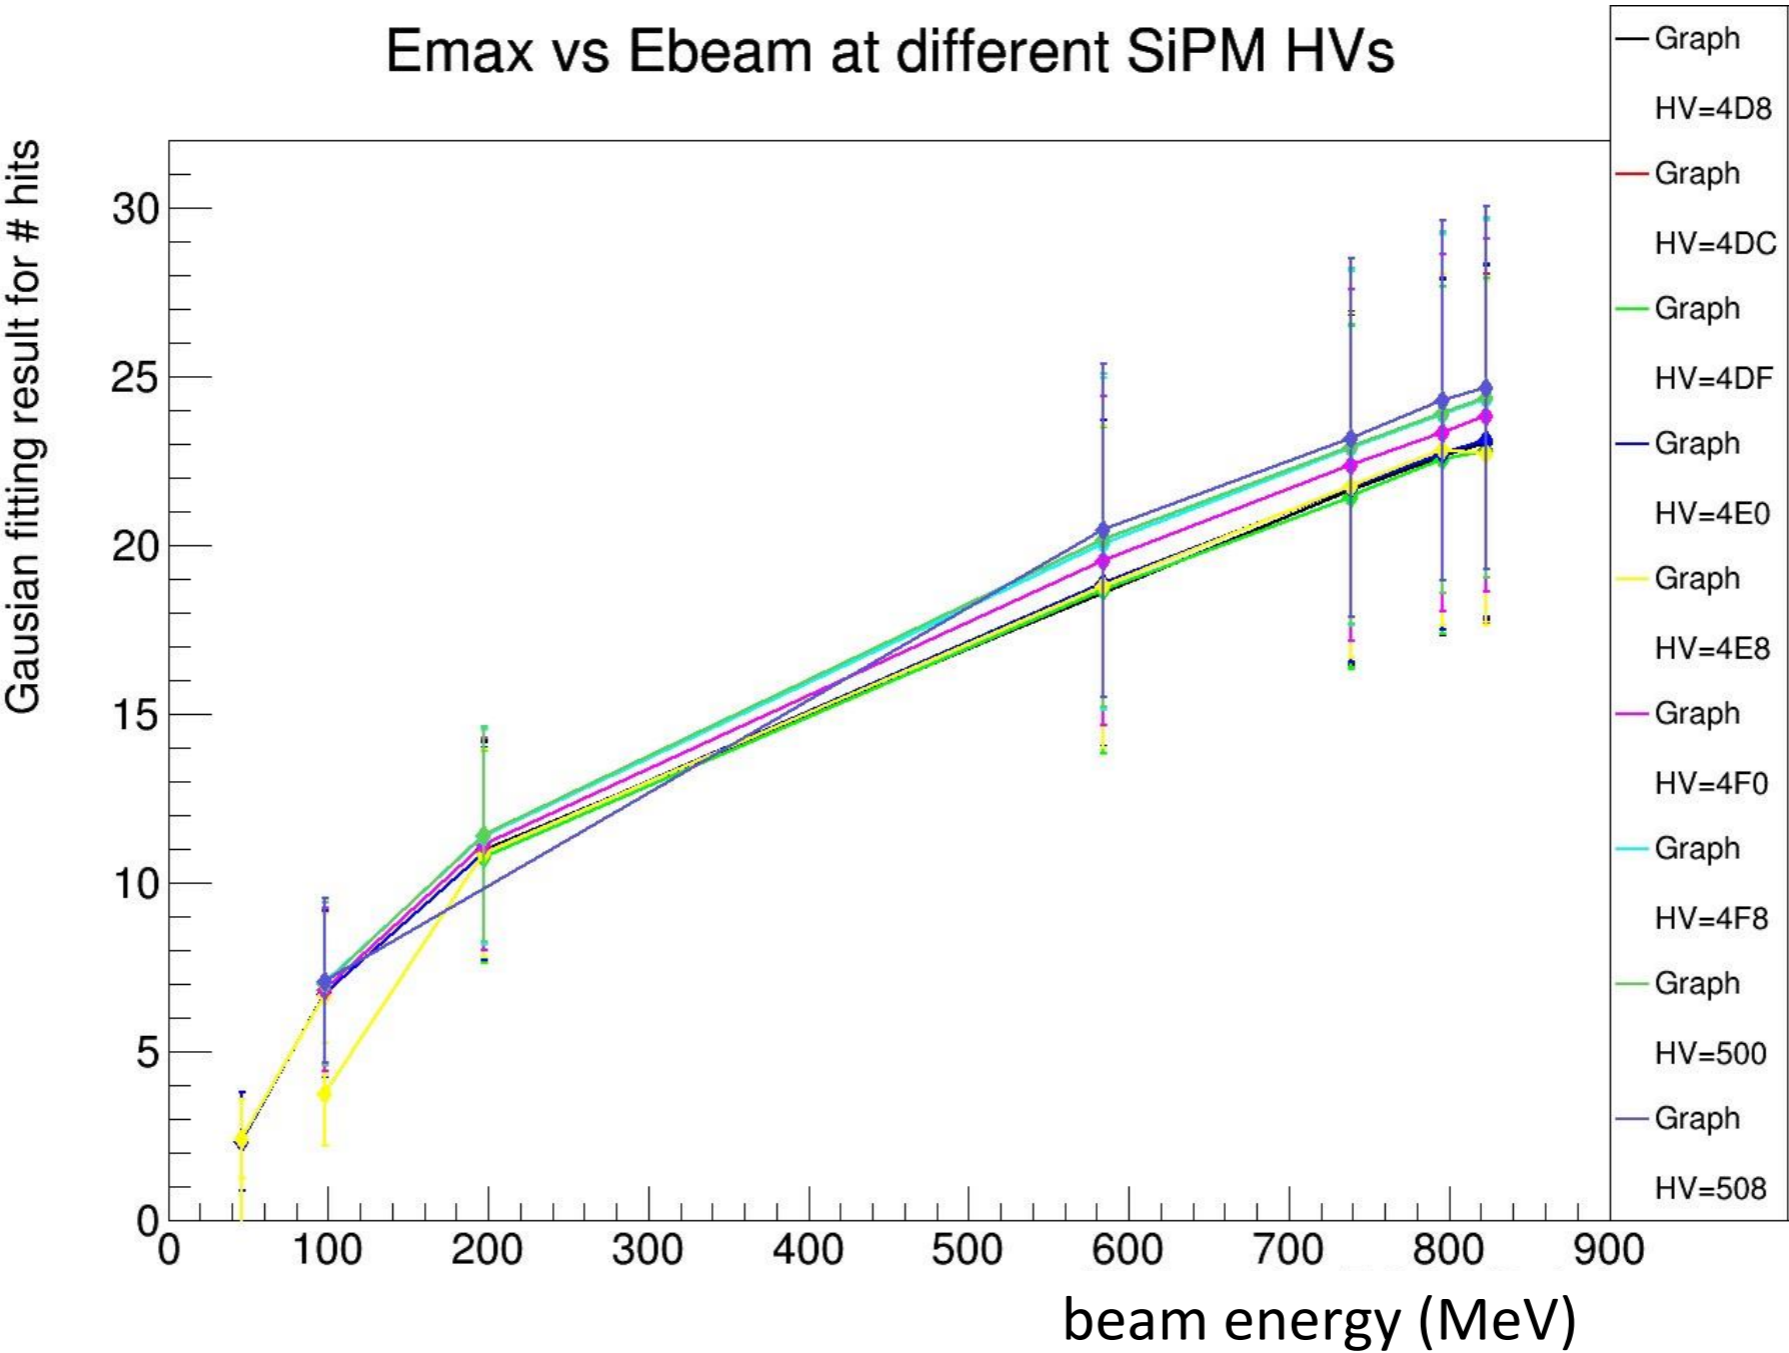

# $E_{\max}$ vs Beam Energy

$E_{\max}$  vs  $E_{\text{beam}}$  at different SiPM HVs

- Detailed analysis with more runs is being carried out

# Number of Hits vs Beam Energy

- To be compared with simulation

# Number of Hits vs $E_{\max}$

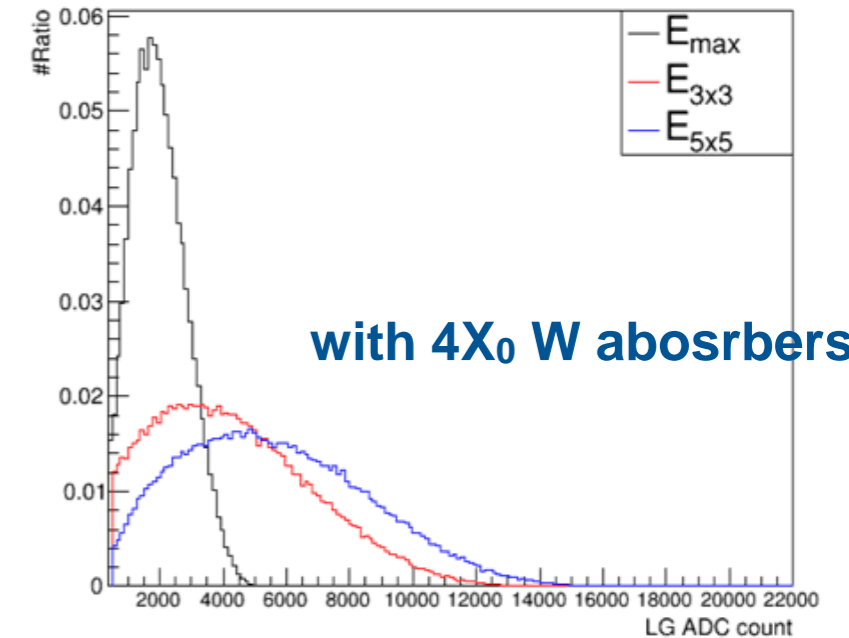

- Temporarily require to have at least 3 hits

# Cluster Energy

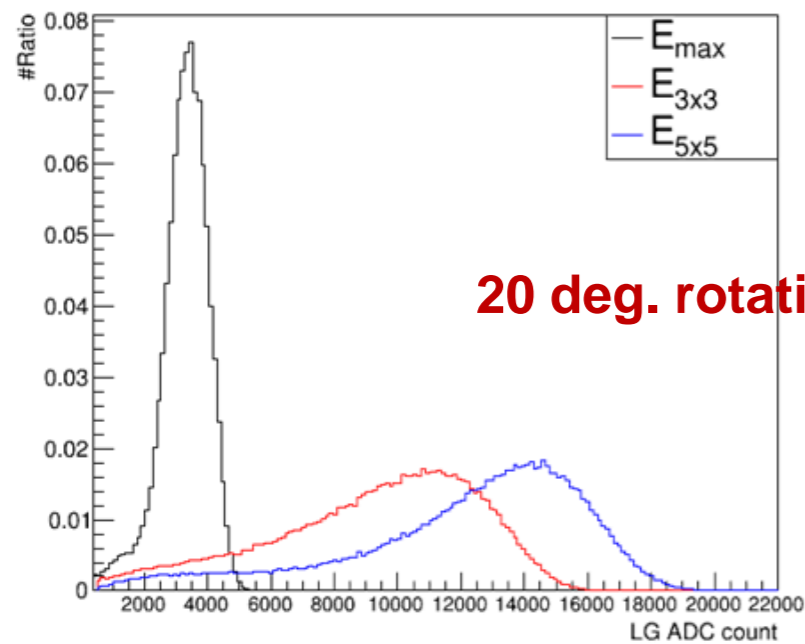

(Original) Peak channel of HV 24.84V @197MeV

( $4\chi_0$  W) Peak channel of HV 24.84V @197MeV

(Rotate 20°) Peak channel of HV 24.84V @197MeV

(Rotate 90°) Peak channel of HV 24.84V @197MeV

(Rotate 180°) Peak channel of HV 24.84V @197MeV

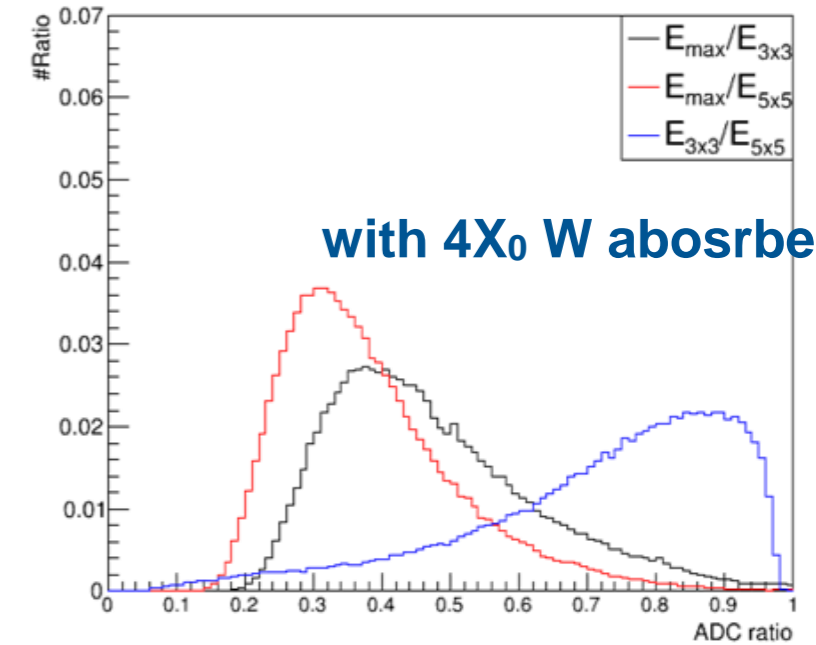

- To be compared with simulation

# Shower Shapes

(Origin) Peak channel of HV 24.84V @197MeV

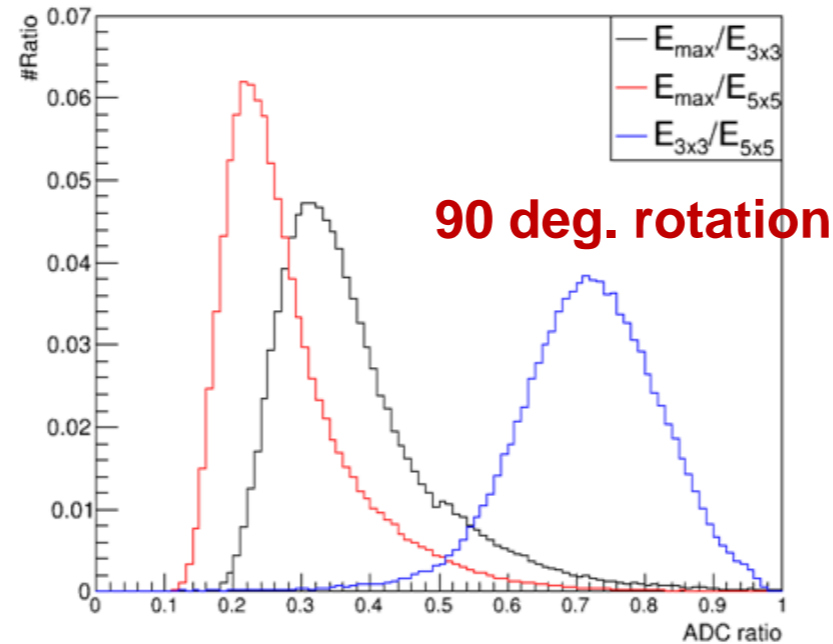

(4 $\chi_0$ W) Peak channel of HV 24.84V @197MeV

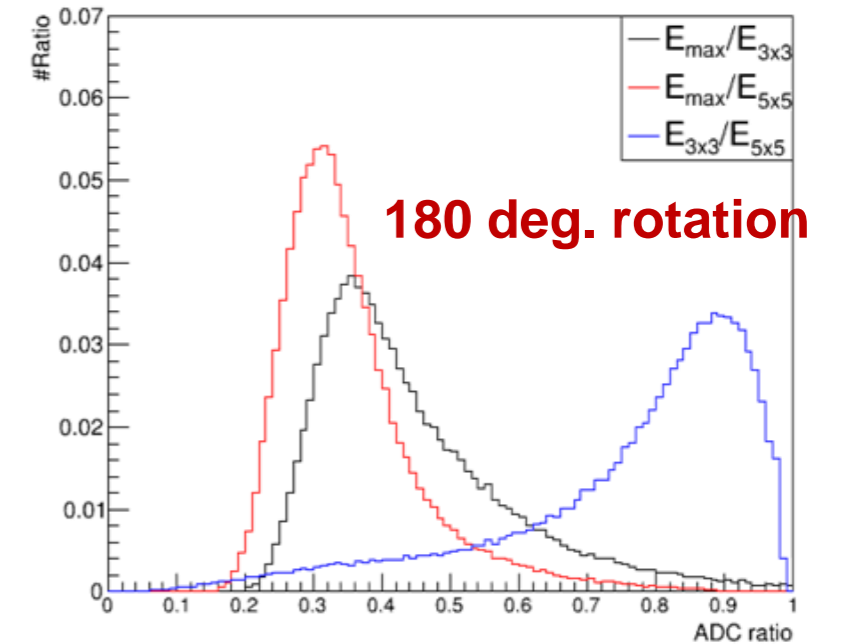

(Rotate 20°) Peak channel of HV 24.84V @197MeV

(Rotate 90°) Peak channel of HV 24.84V @197MeV

(Rotate 180°) Peak channel of HV 24.84V @197MeV

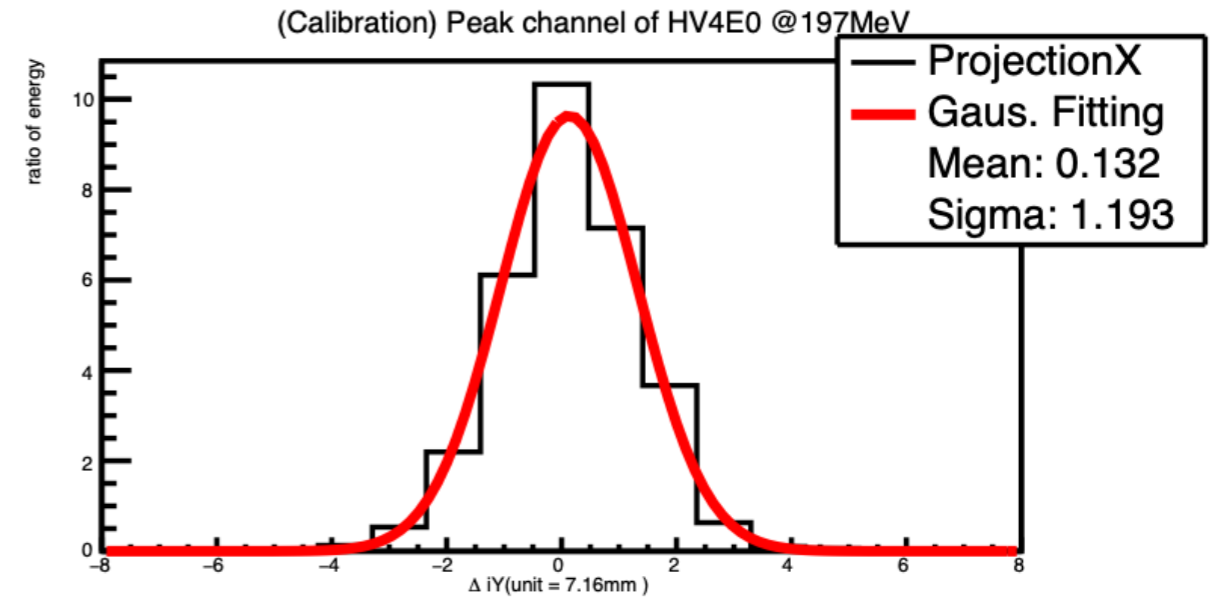

- To be compared with simulation

# Beam Profile

- Beam position is calculated with energy weighted method

# Shower Spread

# “Standalone” Simulation

- The first round of simulation with different beam energies,  $4X_0$  W absorber, and different rotation angles was done

# Preliminary Simulation Results

197.9 MeV positron beam with  $4X_0$  W absorbers

# Simulation with “Realistic Beam”

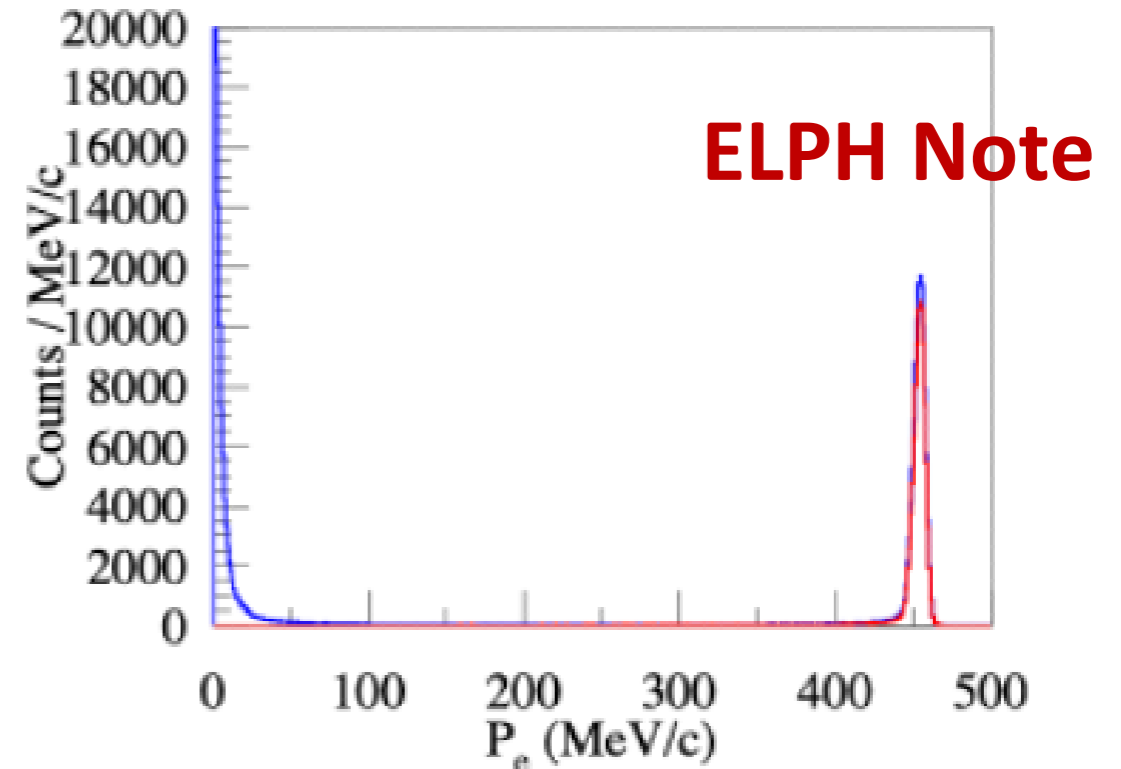

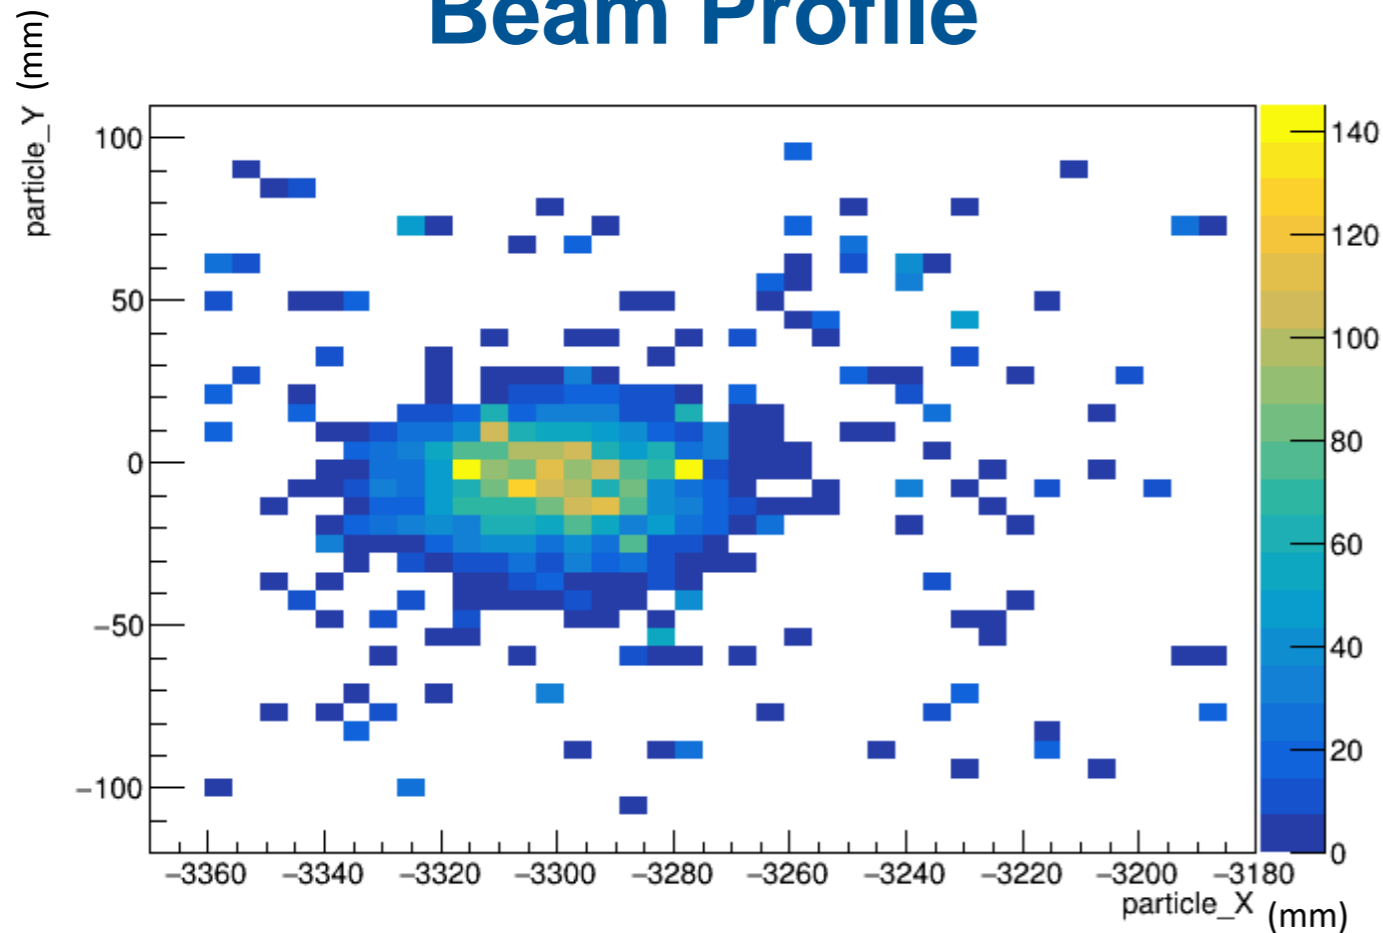

# Very Preliminary Simulation Results

## Particle Momentum

### Beam Profile

# Future Plan:

- Finalize the analysis of beam test data as soon as we can
- Target at another beam test at ELPH in October
  - LYSO + APD
  - PbWO<sub>4</sub> + SiPM
  - GAGG + APD
  - Combine with other detectors
- Perform simulation studies for the final ZDC EMCAL design

# Summary

- We had the first beam test for the prototype of ePIC ZDC EMCal with LYSO+SiPM at ELPH
- Both data analysis and simulation are on-going
- We hope to be able to test different combinations of crystals and photodetectors in October
