

# HRPPD Progress Report – March 21, 2024

Arshak Asaturyan, Beni Zihlmann, Carl Zorn (presenter) - JLAB  
Alexander Kiselev (BNL)  
March 21, 2024

**HRPPD #15 – EIC #1**

# Initial JLAB Test Program

---

- **JLAB purchased 5 initial samples of current generation of HRPPD**
- **@ JLAB → Show that the device is “alive” so that it can “approved” and payment made to Incom**
- **Collect data on all 1024 channels (if possible) and whatever other data can be collected in reasonable time frame**
- **Then ship to BNL for full test program**
- **Eventually JLAB will build full test station (Arshak Asaturyan)**
- **Yale is also preparing full test station**

# Two setups

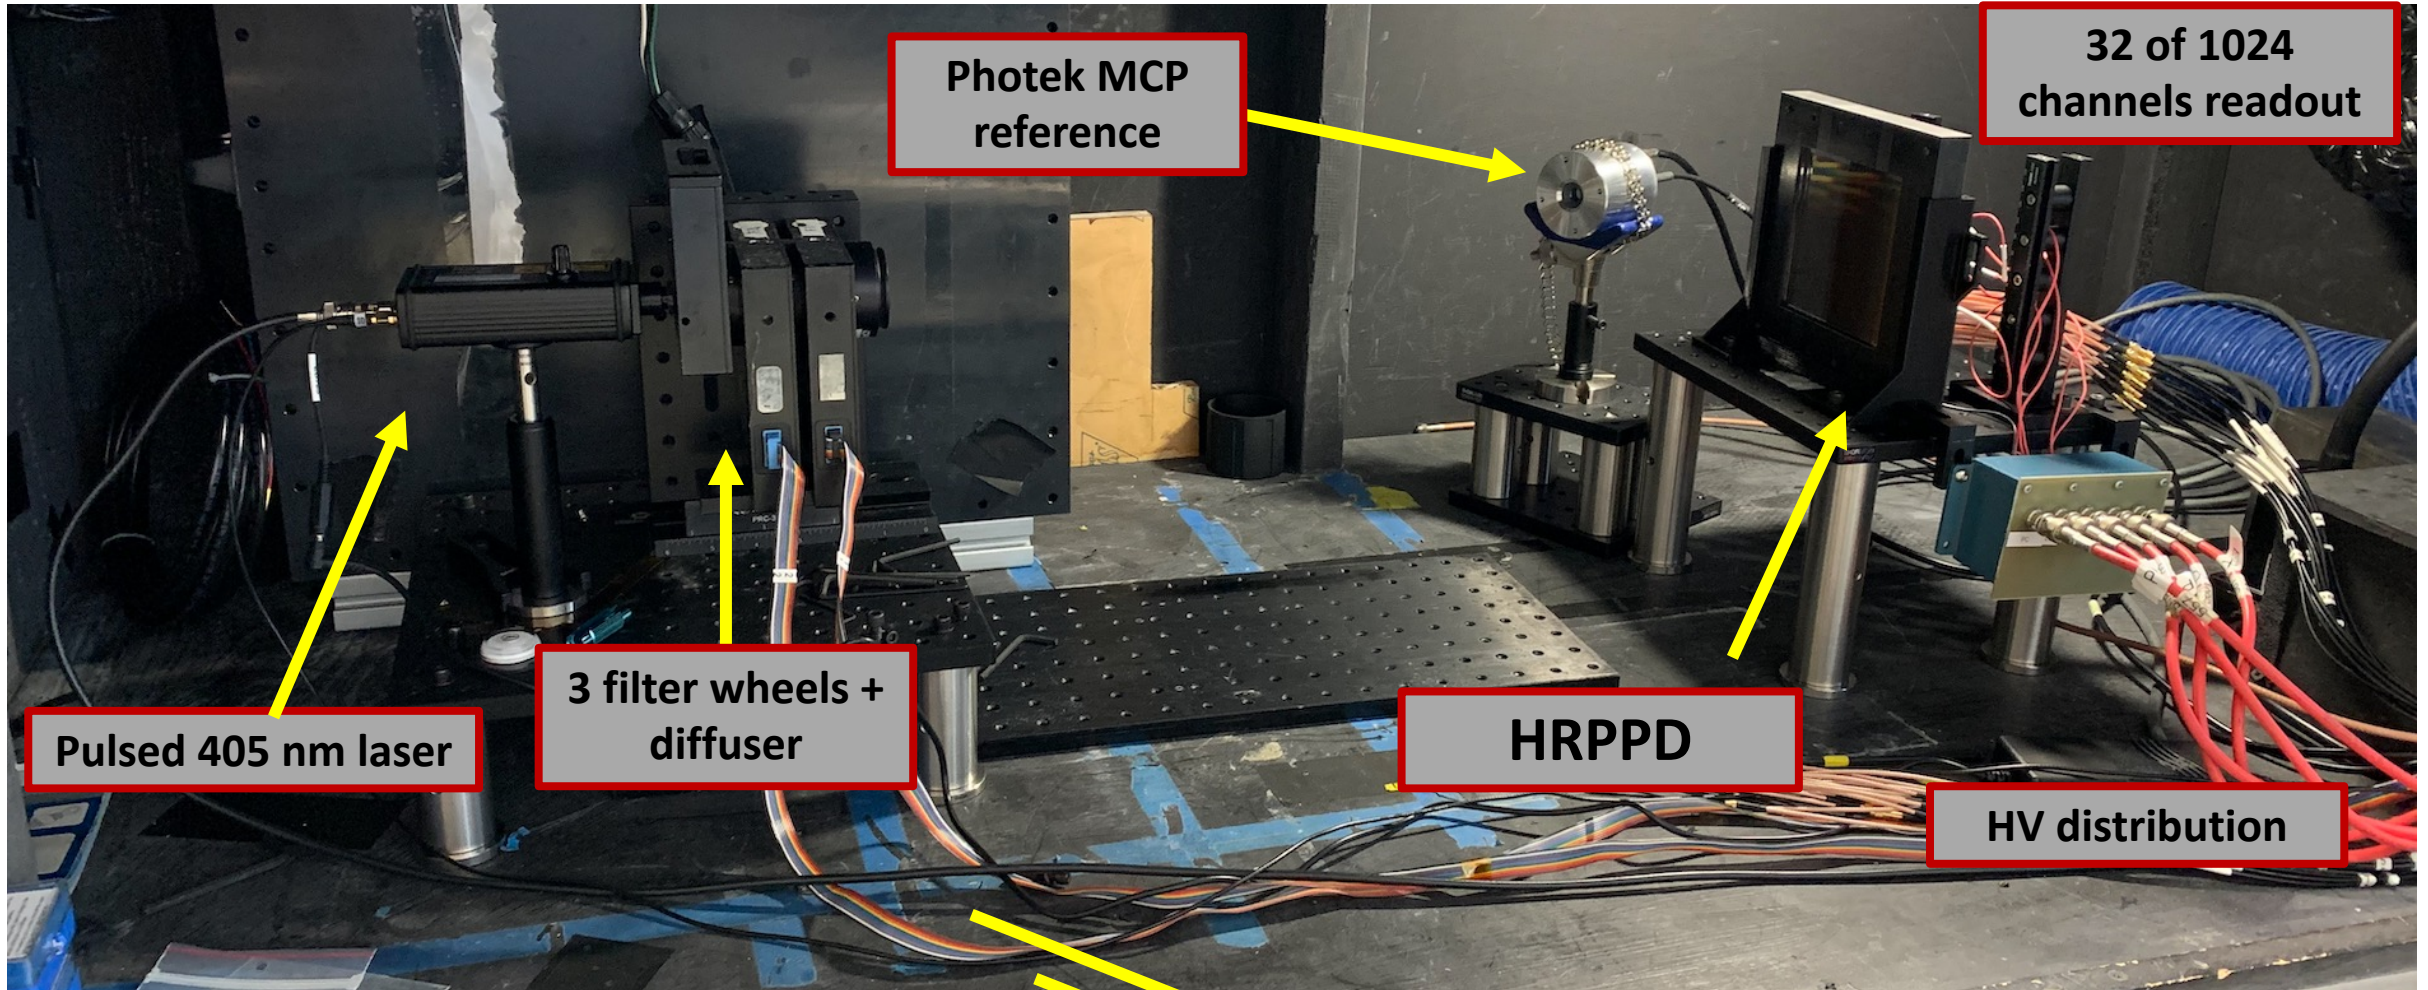

Current – ARC L215 - Detector Group Lab

In preparation for future full test program

# Current Test Setup

# Status of JLAB setup

- Much of HRPPD readout equipment is on loan from BNL – HRPPD enclosure, 3D-printed parts, interposers, readout board + connectors, MMCX adapters, MCX cables – thank you Alexander
- We have VME crate with QDC and new V1742 digitizer (both 32 channels) – but need JLAB DAQ personnel to finish the JLAB software/hardware setup
  - Have several oscilloscopes on hand
- Initial data for now based on oscilloscope measurements (transit time variation) and dark rate studies with NIM electronics
- Measurement test program is still evolving 
- Note – every HRPPD sample comes with test report generated by Incom
- We have weekly Wednesday meetings with Incom to discuss status
- For those with JLAB computer access <https://logbooks.jlab.org/book/hrppd>

# Setup in Darkbox

# Install interposers between anode array and readout board

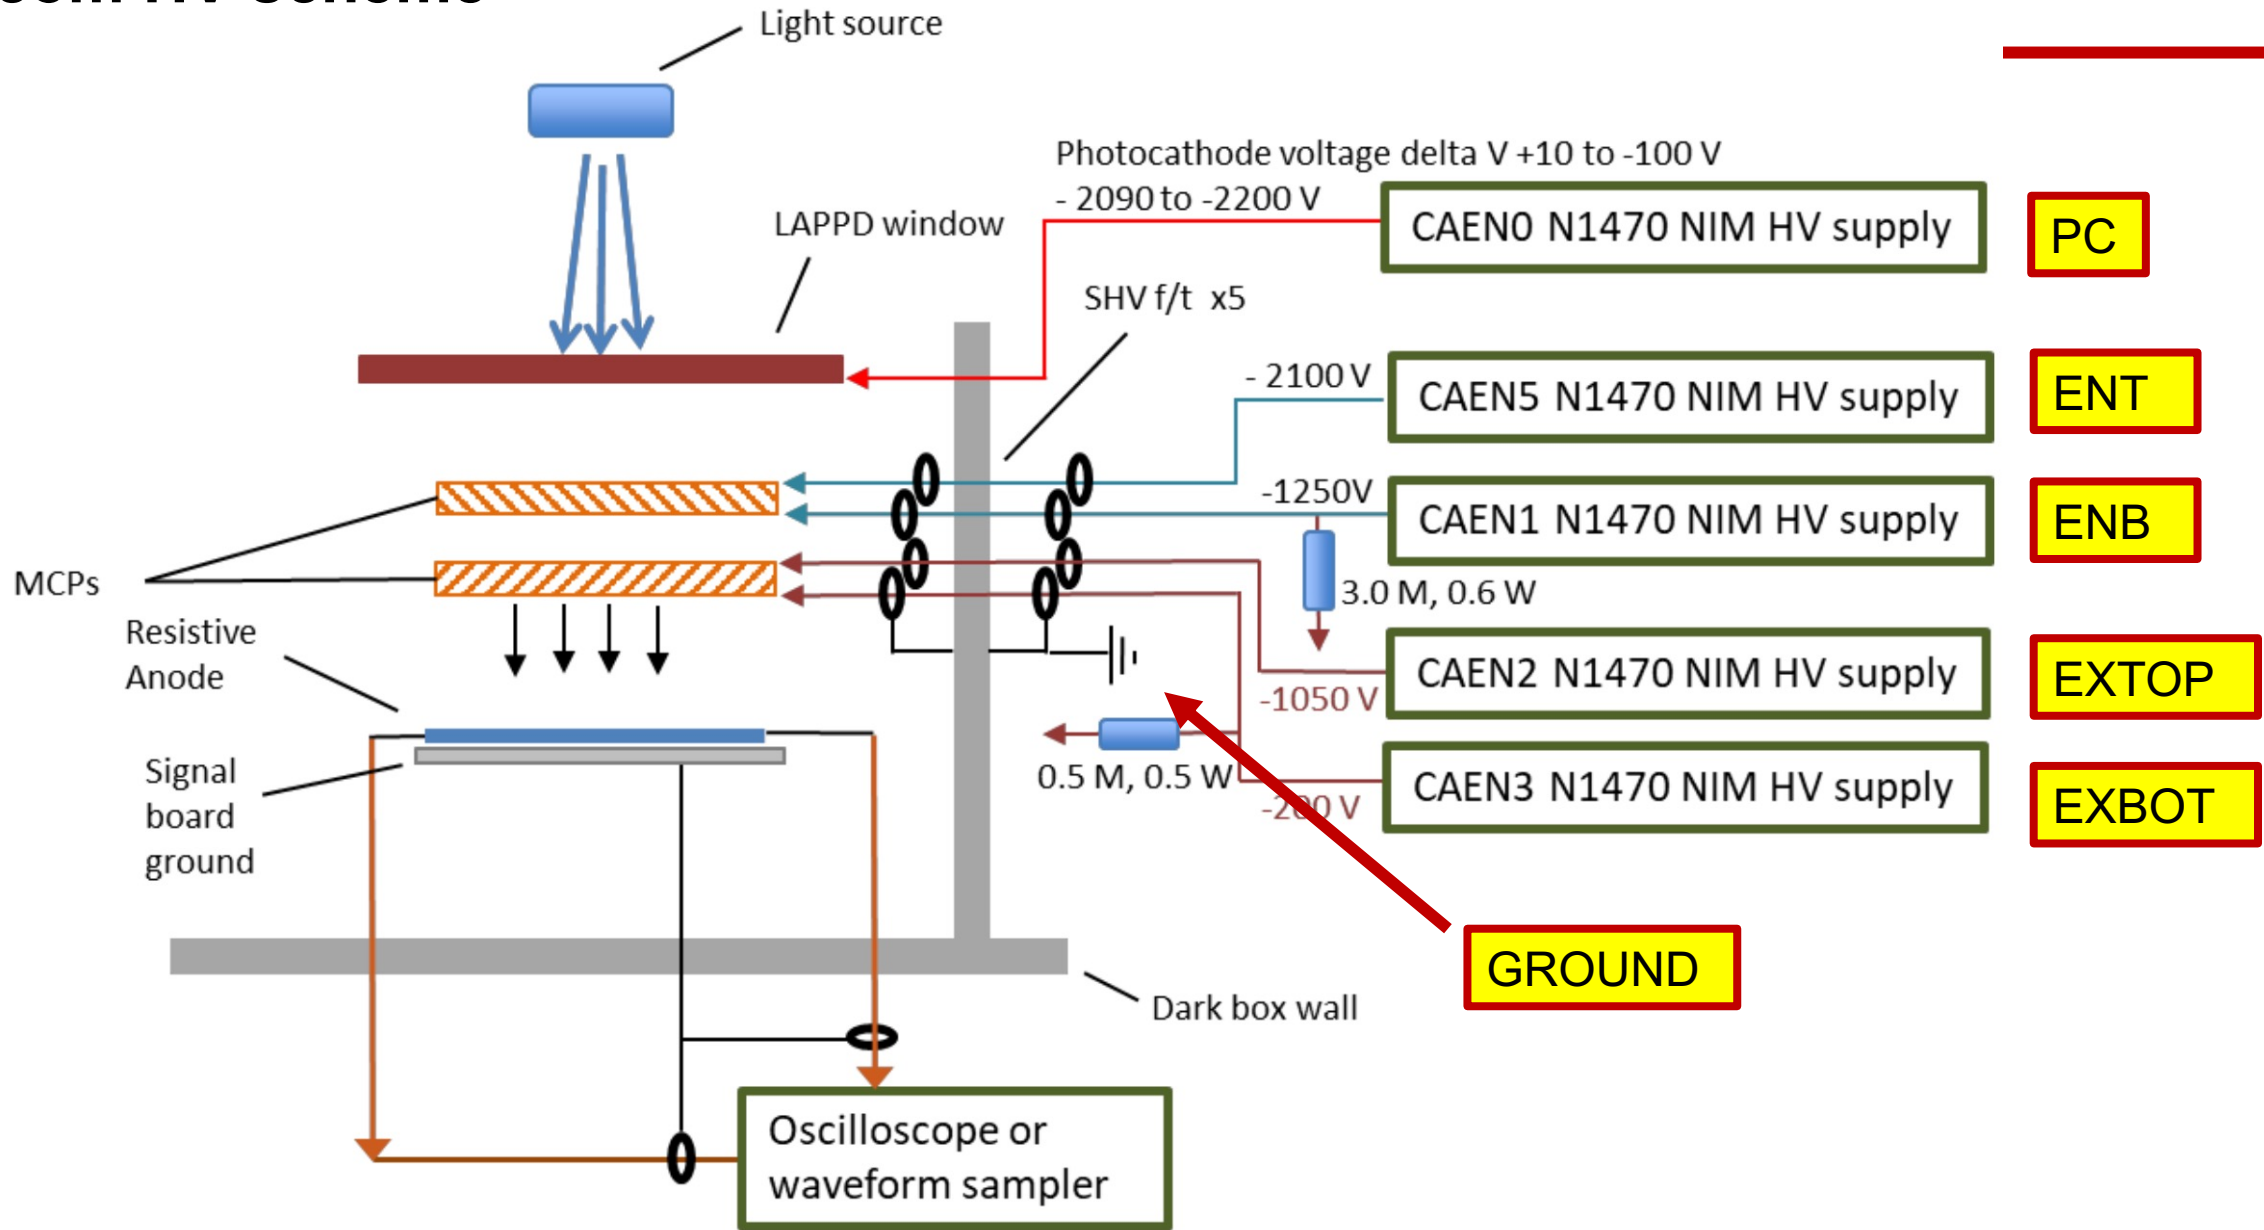

Samtec interposers

# HRPPD 18

**2-56 screws  
attached to ceramic**

## Some Notes for first four HRPPD samples

---

- when tightening small nylon 2-56 nuts – found that several of the screws would simply pop off with very small torque
- In addition – some HV power pins would also come off when installing or removing HV connections despite the care taken
- First two (#15 & #16) shipped back for repairs
- Third (#17) was operated and (noisy) signal seen despite ground pin broken – afterwards sent back to Incom for repair
- Fourth (#18) is first to operated with minimum problem despite loss of some screws – and excessive glue made it difficult to attach readout board - it is also being returned to Incom (5 screws popped off)
- Repaired #15 and #16 are back onsite - #15 operating successfully

# Example pulses

Laser trigger

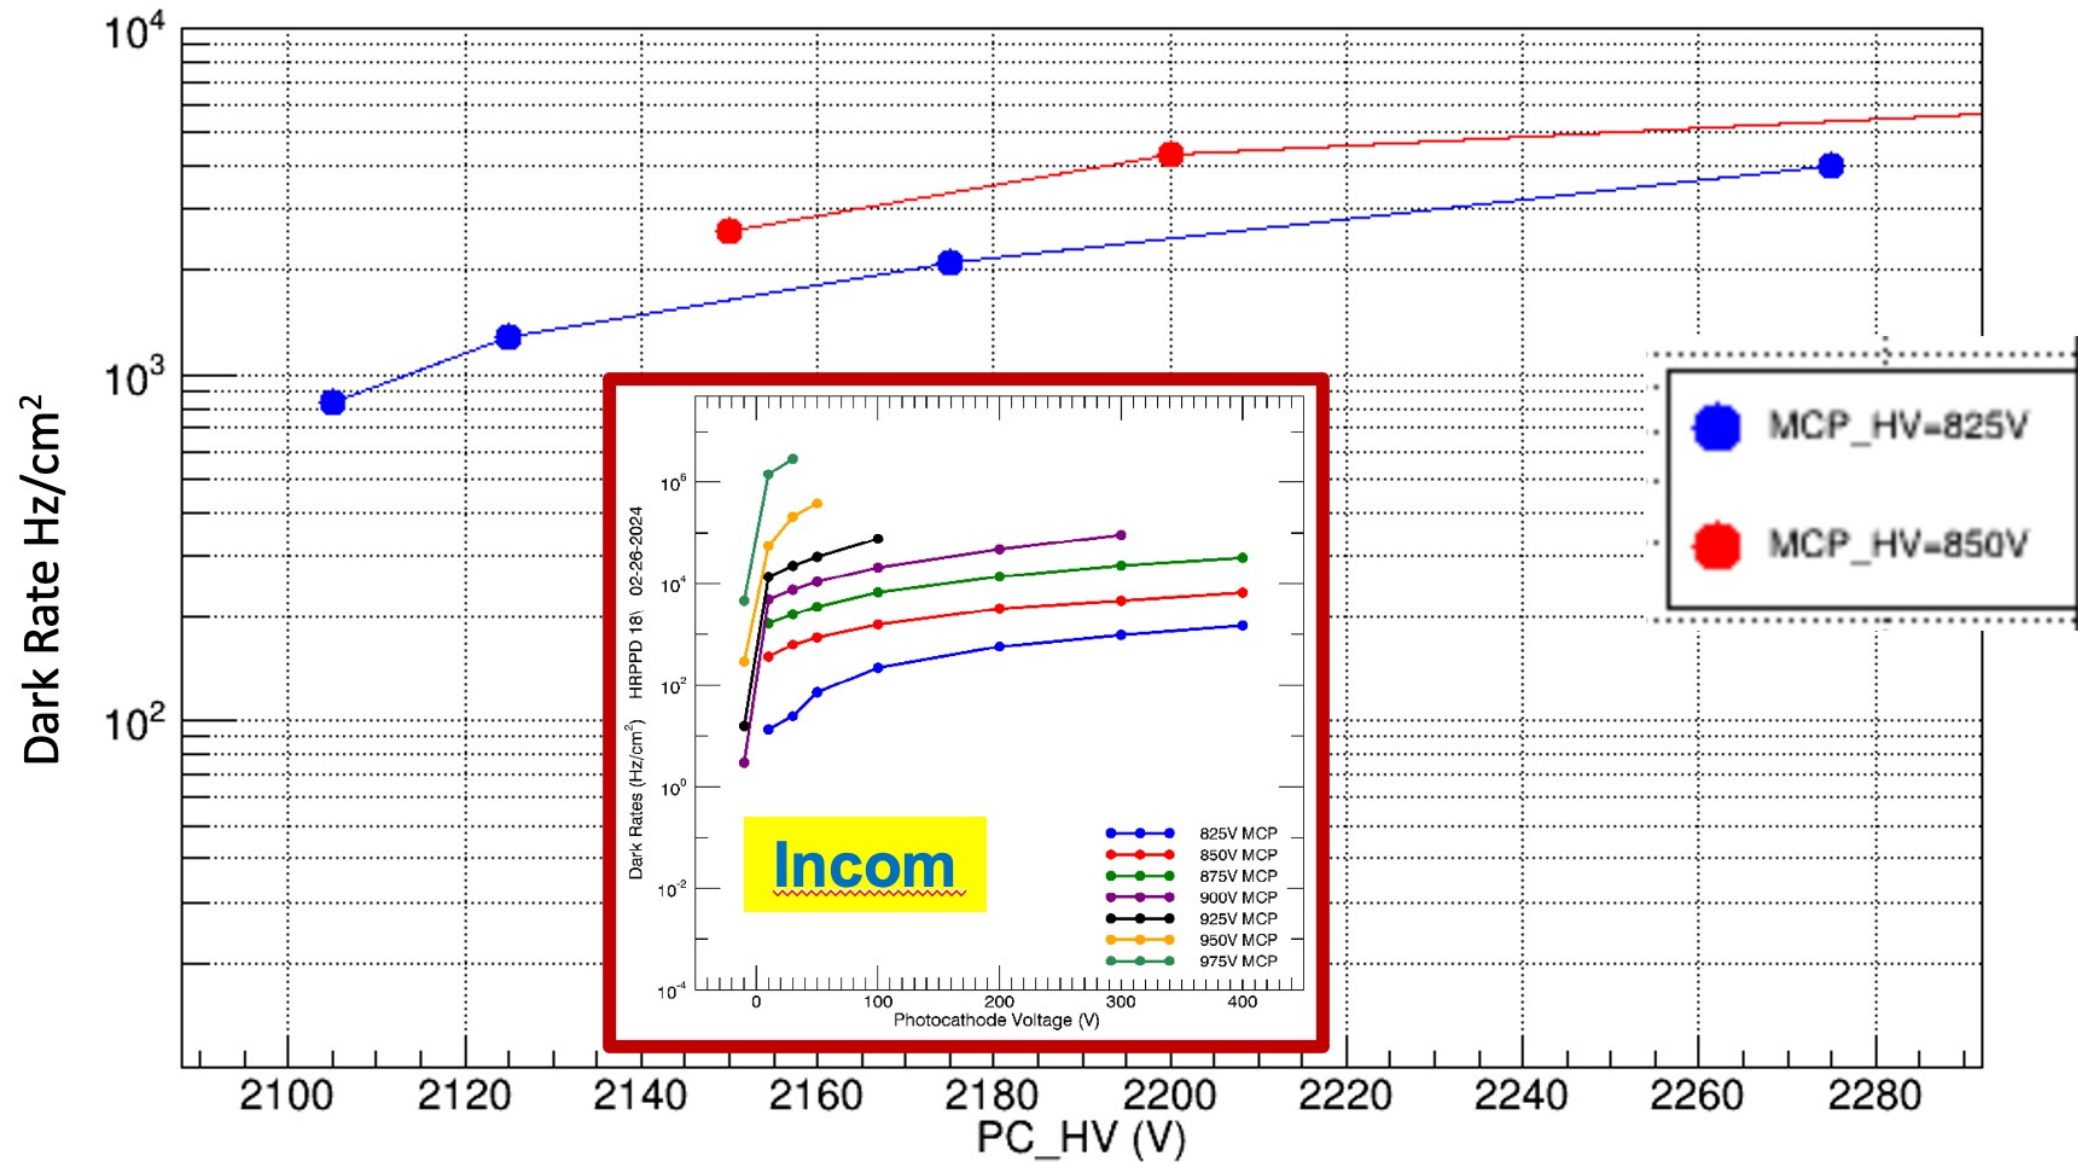

# Dark Rate Measurements

Incom uses oscilloscope directly – measures the Trigger rate on dark pulses  $> 4$  mV

# HRPPD#4 (INCOM#18)

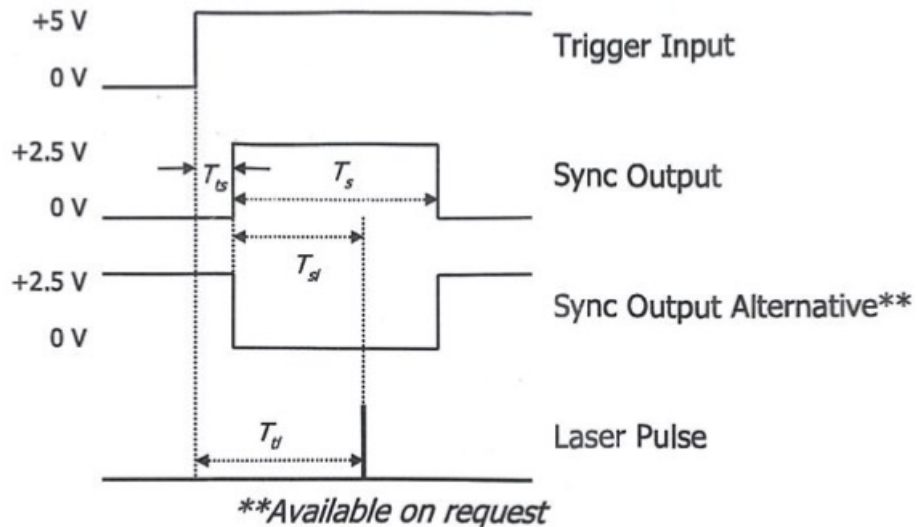

# HRPPD#1 (INCOM#15)

- Transit time variation (TTV) measured with scope with SPE levels of light - laser intensity attenuated to  $4 \times 10^{-5}$  (neutral density filters) plus diffusion filter + black mask with 3 mm hole
- Laser trigger rate = 3 kHz
- TTV = 125 ps for HRPPD #17 and 102 ps for HRPPD #15

<i>Typical Timing Parameters</i>	
Trigger – Laser Delay $T_{tl}$	46 ns
Trigger – Sync Delay $T_{ts}$	14 ns
Sync – Laser Delay $T_{sl}$	32 ns
Sync Pulse Width $T_s$	90 ns
$T_{tl}$ Jitter	3 ps r.m.s.
$T_{sl}$ Jitter	2 ps r.m.s.

Incom  
71 ps

# Summary

---

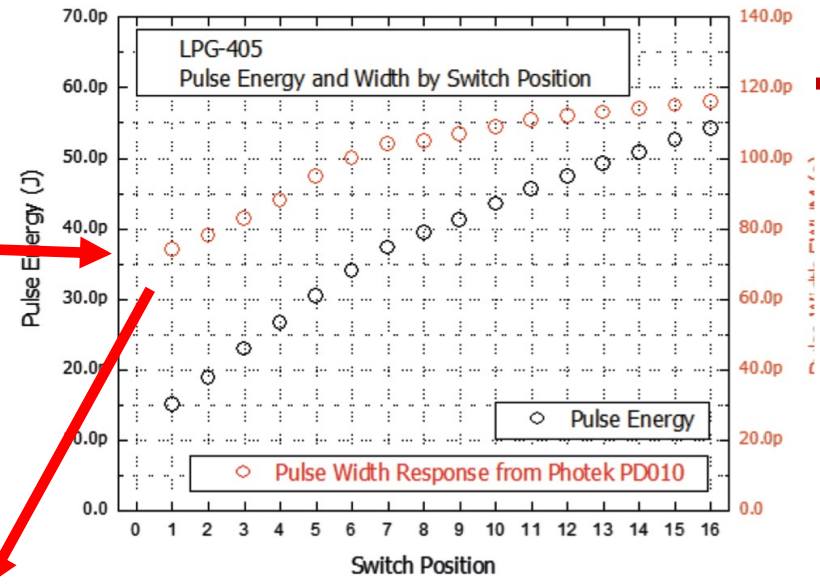

- Lots of time lost in dealing with initial mechanical problems – spending time on repair cycle - these issues needs to plateau at some point
- Need to get full DAQ up and running for efficient test system
- Need criteria for Pass/Fail of HRPPD for QA purpose → pay for module before shipment to full test center (BNL) – BNL is very eager to start their program
  - Test signals from all 1,024 channels?

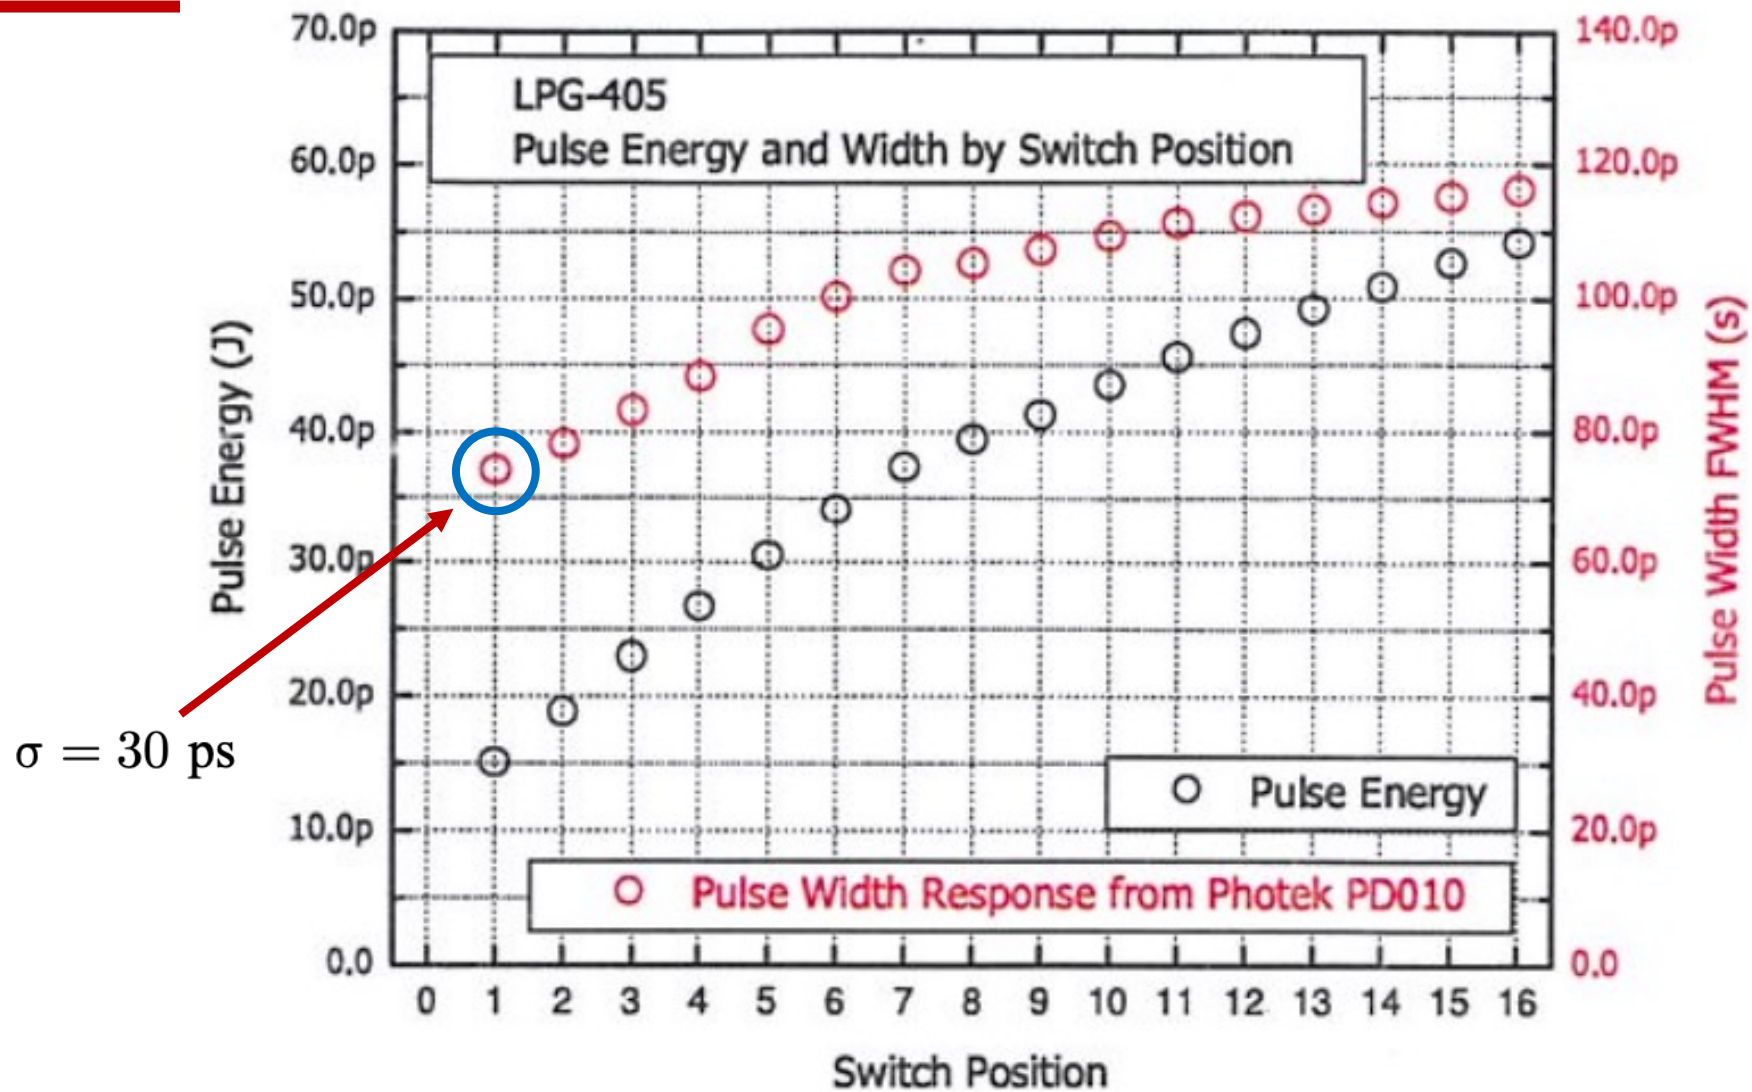

---

# Appendix

**Photek LPG-405 pulsed laser**  
405 nm - pulse width = 75 ps  
Freq range = single shot to 300 kHz  
Class 1(!!!) – inherently eye safe

$$\text{FWHM} = 2\sqrt{2\ln 2} \sigma \approx 2.355 \sigma$$
