

# IRRADIATION TESTING OF COMMERCIAL DC|DC BUCK CONVERTERS FOR ePIC

May 15<sup>th</sup> 2024, UC Davis Crocker Cyclotron

Presentation for DAQ & Electronics

Gerard Visser Indiana CEEM

Tim Camarda for BNL

**With contributions for irradiation studies from:**

Alex Jentsch, BNL (simulations for ePIC)

- **Testing requirements**
- **Irradiation results & plots**
- **Next steps**

DUT at Cyclotron facility, proton exit window ( $\varnothing$ 6cm)

# General Power Requirements

- All devices selected for testing were selected on their electrical characteristics & are candidates for various detector electronics use at ePIC
  - ✓ Noise  $< 0.5\%$  , Ripple<sub>(20MHZ BW)</sub>  $< 0.3\%$
  - ✓ Efficiency: at least 70%
  - ✓  $V_{IN}$  12V – 15V  $V_{OUT}$  1V – 5V
  - ✓ Power Density & Footprint Constraints
  - ✓ Magnetic field (2 Tesla) => non-iron core inductors

## Radiation testing requirements

- **Radiation Tolerant to a Fluence of ( $1 \times 10^{12}$  /sec/ cm<sup>2</sup>) ten operational Years, 1MeV equivalent damage**
- **TID (100K<sub>RAD</sub>)**

# IRRADIATION REQUIREMENTS & BEAM CONDITIONS

Reference slide 16 for cyclotron configuration screen

A. Akkerman et al. | *Radiation Physics and Chemistry* 62 (2001) 301–310

Fig. 6. The relative damage,  $K_p/K_n$ , as a function of proton energy where  $K_n$  is taken for 1 MeV neutrons.

Proton energy => **64MeV**

Cyclotron flux => **1.24E8 /sec cm<sup>2</sup>** (what the cyclotron delivers)

Beam width => **6.0cm**

Beam Current => **2.0nA** scaled for 1MeV neutron equivalent damage

Flux at 2nA => 2.0nA x 1.24E8 /sec cm<sup>2</sup> = **2.48E8/ sec cm<sup>2</sup>**

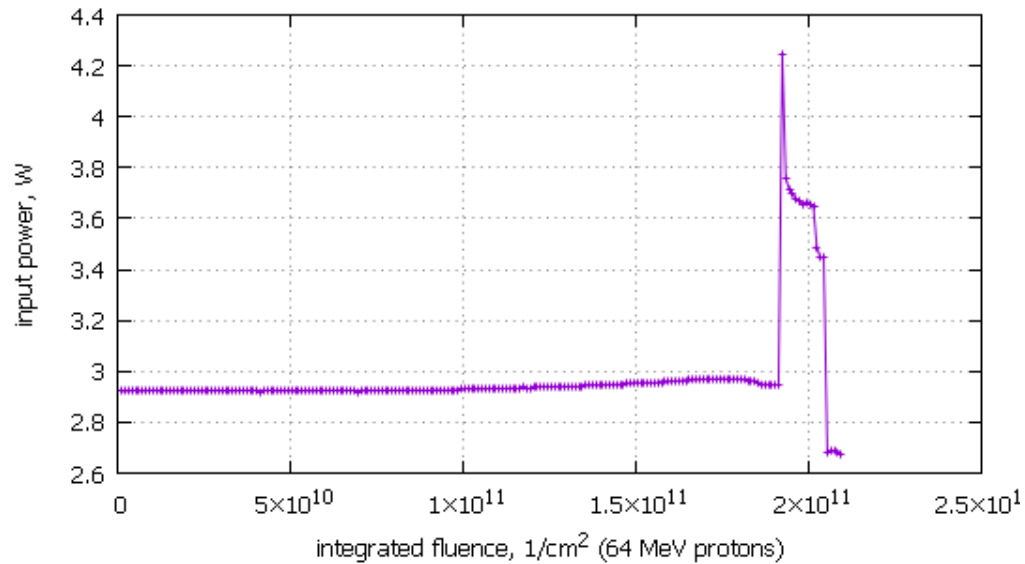

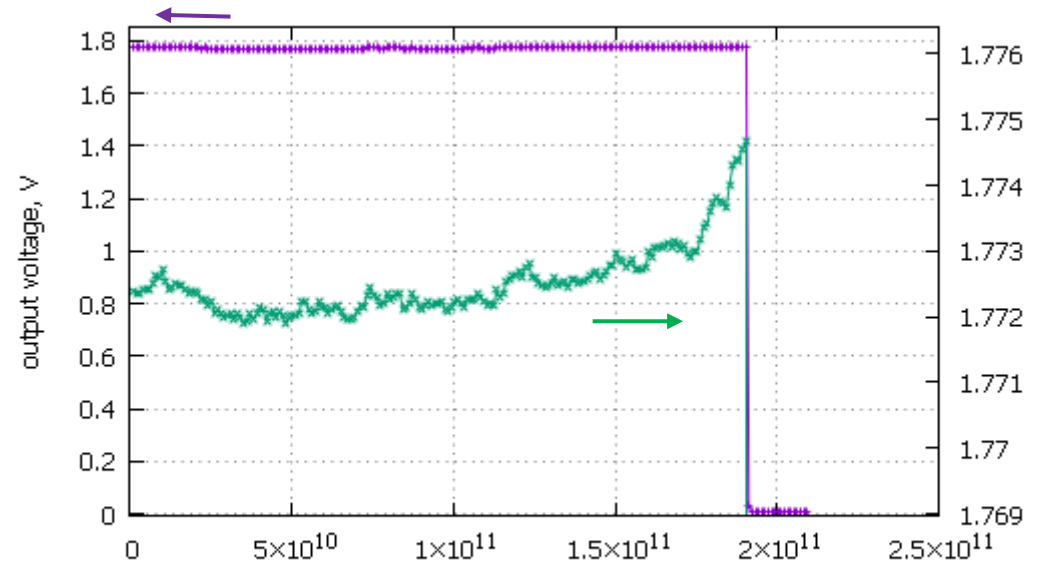

Proton fluence integrated for 10 operational years (1MeV neutron equivalent)

=> **1.0E12 n /sec cm<sup>2</sup>**

Irradiation time to full fluence => 2700 seconds (45 min)

# IRRADIATION TEST RESULTS

DEVICE	LTC3600 (1.5A)
Vin to Vout	13 V to 1.8 V
load	1.5 $\Omega$ (1.2A)
64 MeV p flux	2.49E8 p/cm <sup>2</sup> *s
2% output deviation	no significant deviation
unstable/flaky	no
output dead	1.90E11 p/cm <sup>2</sup>

also see bonus plots in backup slides for Vref out

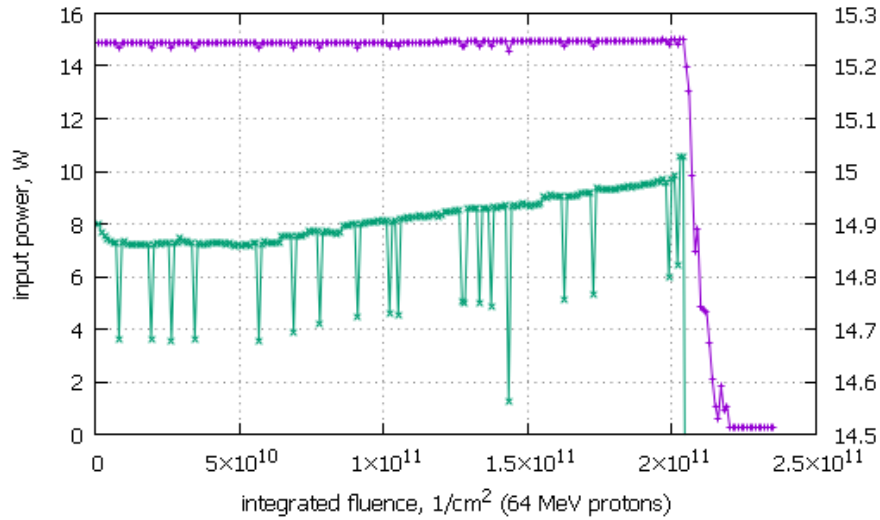

# IRRADIATION TEST RESULTS

DEVICE	LTC3626 (2.5A)
Vin to Vout	16 V to 1.8 V
load	1.5 $\Omega$ (1.2A)
64 MeV p flux	2.33E8 p/cm <sup>2</sup> *s
2% output deviation	no significant deviation
instability	no
output dead	1.92E11 p/cm <sup>2</sup>

Exposure time until part failed:  $1.9E11 / 2.48E8 / \text{sec}$   
= 13 minutes => ~30% of specified fluence

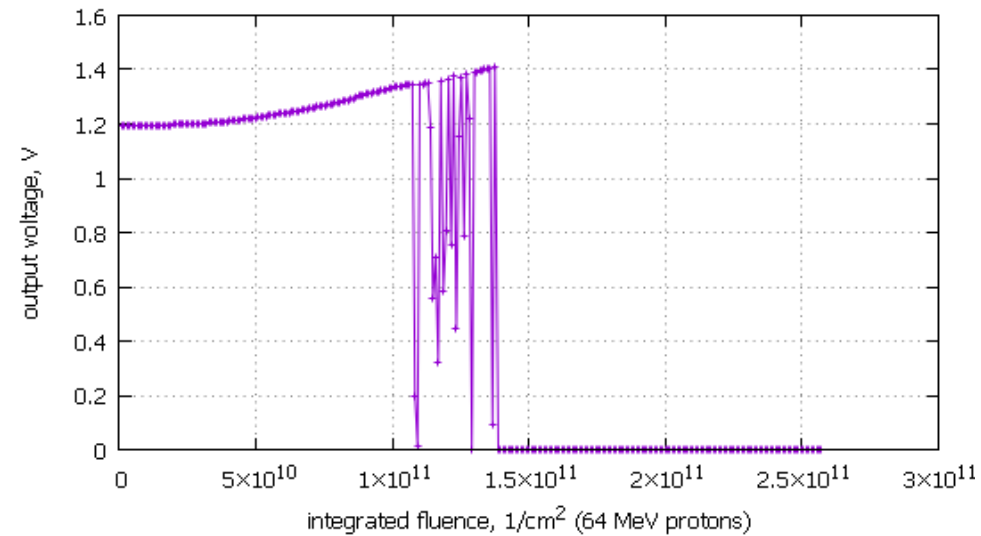

DEVICE	LTC7890 (2-ch) (15A /ch)
Vin to Vout	12 V to 1.2 V
load	0.2 $\Omega$ , 0.28 $\Omega$ (6A, 4.3A)
64 MeV p flux	2.51E8 p/cm <sup>2</sup> *s
2% output deviation	(<20mV <sub>P-P</sub> )
instability	slight instability observed
output dead	2.06E11 p/cm <sup>2</sup>

NOTE: Some efficiency effects can be contributed to variations caused by temperature coefficient ( $\pm 400\text{ppm}/^\circ\text{C}$ ) of the load resistors. This applies to all tested devices.

DEVICE	MP2318 (2A)
Vin to Vout	14 V to 1.2 V
load	1 $\Omega$ (1.2A)
64 MeV p flux	2.35E8 p/cm <sup>2</sup> *s
2% output deviation	4.83E10 p/cm <sup>2</sup>
instability	1.08E11 p/cm <sup>2</sup>
output dead	1.38E11 p/cm <sup>2</sup>

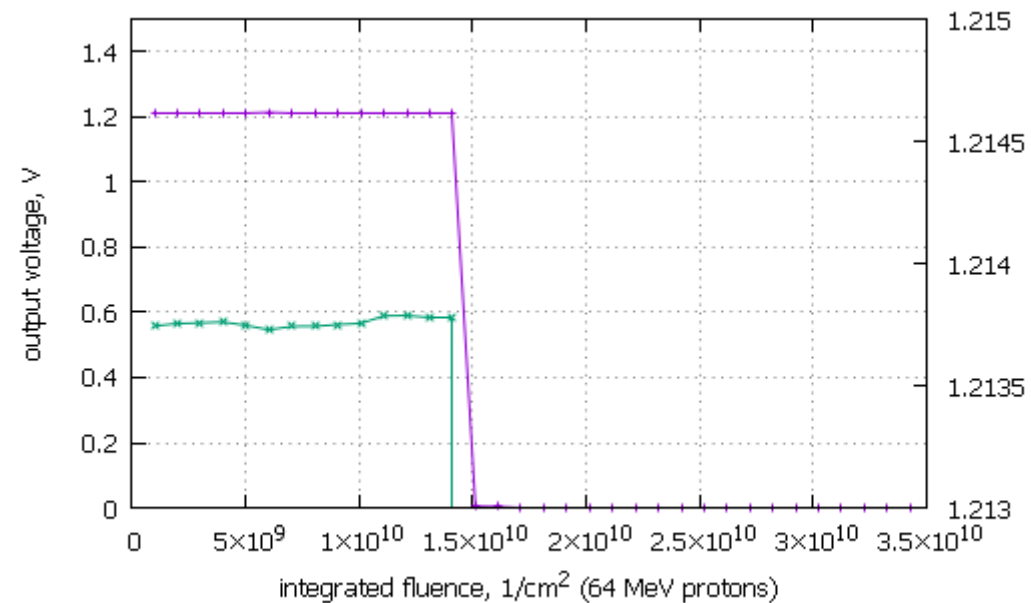

DEVICE	LTC7151 (15A)
Vin to Vout	16 V to 1.2 V
load	0.2 $\Omega$ (6A)
64 MeV p flux	2.49E8 p/cm <sup>2</sup> *s
2% output deviation	no significant deviation
instability	no
output dead	2.21E10

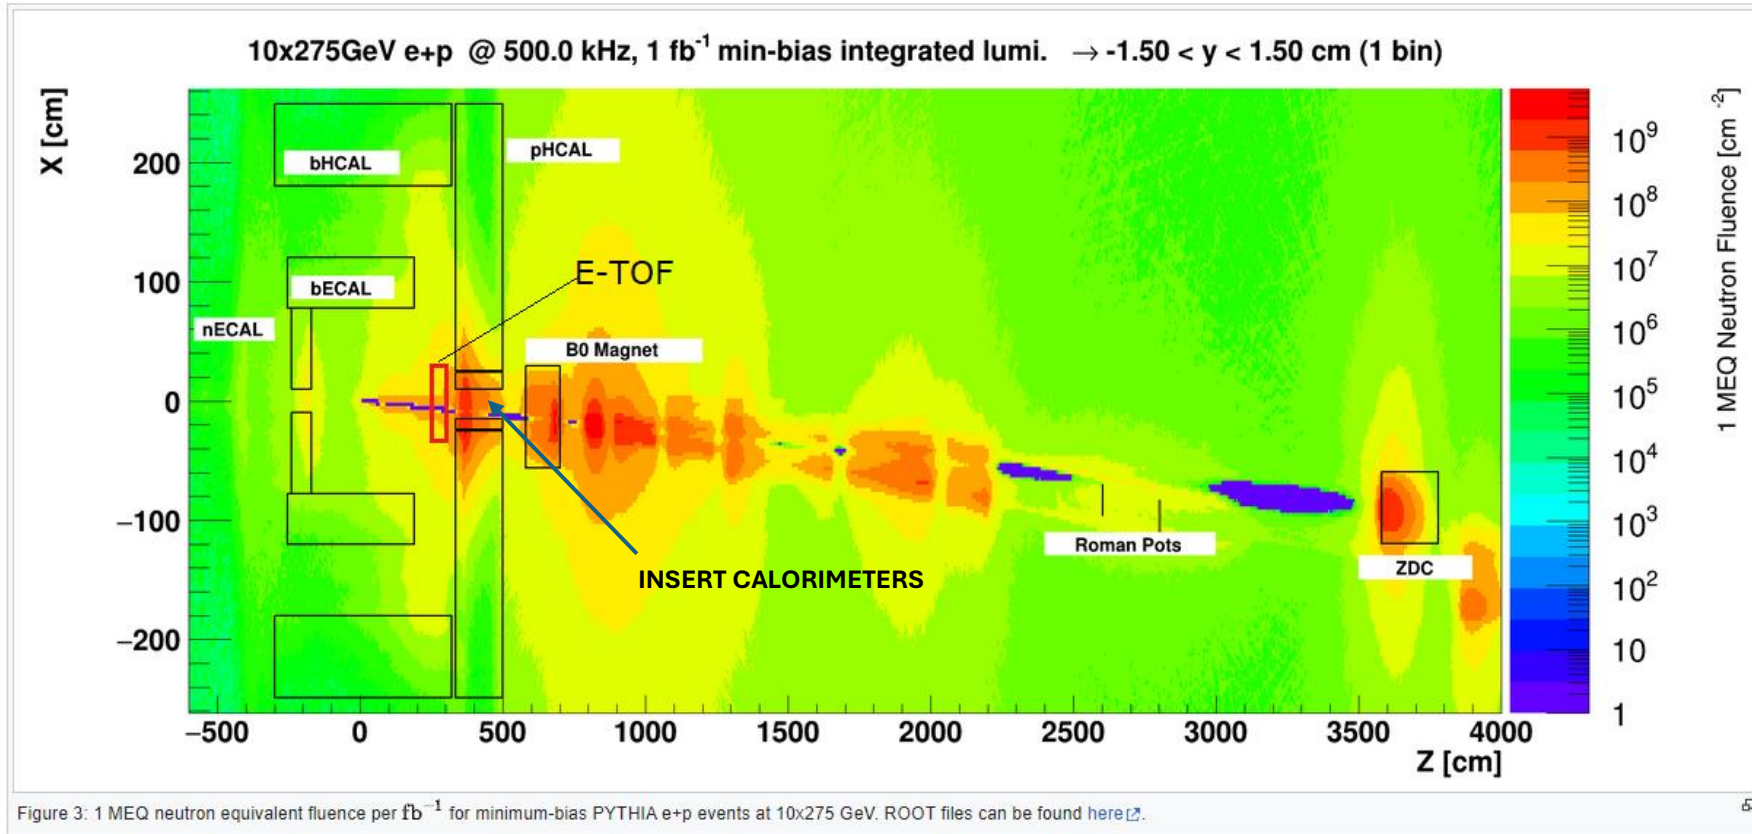

DEVICE	MP2276 (8A)
Vin to Vout	12 V to 1.2 V
load	0.28 $\Omega$ (4.3A)
64 MeV p flux	2.50E8 p/cm <sup>2</sup> *s
2% output deviation	no significant deviation
instability	no
output dead	1.41E10 p/cm <sup>2</sup>

# Neutron Fluence at ePIC:

(1MeV equivalent) fluence normalized for  $1 \text{ fb}^{-1}$

**$100 \times \text{fb}^{-1} = 1 \text{ year}$** . Very conservatively, we can expect an upper bound of  $100 \text{ fb}^{-1}/\text{year}$  of data when the machine reaches top luminosity

Radiation simulation from Alex Jentsch, BNL

# TID from Hadron & Electron at ePIC:

Note: to get the TID for one year of operation:

Ionizing dose (normalized for fb<sup>-1</sup> )

Ionizing dose of  $3 \times 10^2 \times 100 = 30 \text{kRads/ year} \times 10 \text{ years} = 300 \text{kRads}$

Combined ionizing dose from Hadron & Electron sides

[Radiation simulation from Alex Jentsch, BNL](#)

# Non Ionizing Energy Loss

# Neutron induced displacement damage in silicon

A. Akkerman et al. / Radiation Physics and Chemistry 62 (2001) 301–310

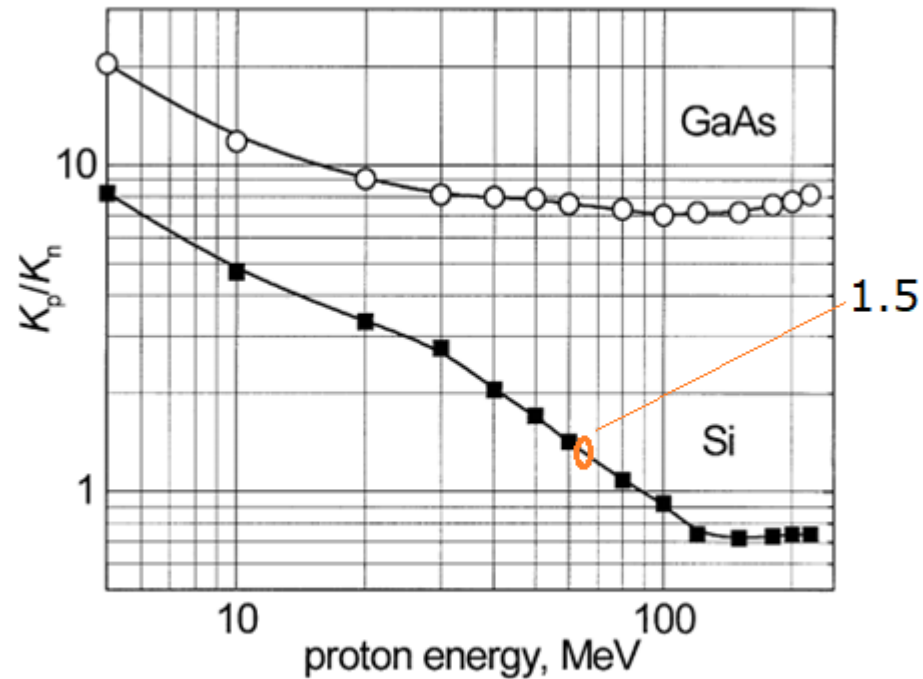

Fig. 6. The relative damage,  $K_p/K_n$ , as a function of proton energy where  $K_n$  is taken for 1 MeV neutrons.

$E_{kin}$ [MeV] P	D/(95MeVmb) Huhtinen
6.500E+01	1.580E+00
1.000E+00	3.133E+01

<https://rd50.web.cern.ch/niel/protons.pdf>

$E_{kin}$ [MeV] N	D/(95MeVmb) Konobeyev
6.000E+01	1.644E+00
7.000E+01	1.499E+00
6.500E+01	1.572+00 (1.644+1.499)/2
1.050E+00	8.020E-01

Source: <https://rd50.web.cern.ch/niel/>

# Testing Conclusions

- LTC7890, LTC3600, LTC3626 => operated SAT for ~ 30% of goal
- LTC7151, MP2318, MP2276 => failed test < 30% of goal
- Any difference between manufacturer? => LT devices seem to hold up better than MPS but inconclusive
- Any of the parts suitable for use in ePIC? => Possible depending on location (need safety margin also)

## What's Next

### From our meeting on Tuesdays discussion of ePIC radiation studies:

**Meeting attendees:** Elke, Alex, Fernando, Gerard, Oleg, Tim

We would like to consult with CERN collaborators who have direct experience with rad hardened specifications & testing.

For example: we would like to see how CERN test their devices compared to our test at UC Davis. This is so that we have a direct 1:1 comparison with CERN rad hard specs.

## PLAN FORWARD FOR POWERING ePIC ELECTRONICS

**Depending on location at ePIC & sub detector, COTS devices will be not suitable:**

- Use a combination of bPOL48V buck controller and Linear Regulators: Example => (24 Vin to 3.3Vout)
  - Output voltage - Vout 0.6 to 24 V => Testing @ 3.3Vout & 1.2Vout
  - [Testing @ 1.2Vout:](#)
  - [Testing @ 3.3Vout:](#)
- Stock still remains for bPOL12V...but would need to purchase a head of time (including spares)

# Cyclotron configuration setup screen

The screenshot displays a software interface for cyclotron configuration and monitoring. It is organized into several sections:

- Current File:** A dropdown menu showing the file path "C:\Riverside\UC-Riverside\_5-15-2024".
- Current Setup:** Parameters for the current run, including:
  - Beam Type: Proton
  - Beam Energy: 64 MeV
  - Target: Silicon
  - IE/dx (MeV·cm<sup>2</sup>/g): 8.334
- Pre-Run:** Diagnostic and leakage measurements:
  - Electrometer Range: 20 nA
  - FC Leakage:  $-7.6e-13 \pm 2.48e-13$
  - SEM Leakage:  $1.33e-11 \pm 1.17e-12$
  - FC/SEM Ratio:  $1.9 \pm 0.0088$
- This Run:** Summary of the current run:
  - Run Number: 3
  - Device Name: LTC3600
  - Run Goal:  $6.6e+11$  p/cm<sup>2</sup>
  - Projected Time:  $2.63e+03$  s
- Statistics:** Real-time performance metrics:
  - Elapsed Time (s): 210.640
  - Beam Current (A):  $2.01e-09 \pm 1.14e-10$
  - Run Dose (Rad):  $7.05e+03$
  - Run Fluence (p/cm<sup>2</sup>):  $5.28e+10$
  - Avg Beam Flux (p/cm<sup>2</sup>/s):  $2.51e+08$
  - Average Beam Current (A):  $2.01e-09$
  - Accumulated Dose (Rad):  $7.05e+03$
  - Accumulated Fluence (p/cm<sup>2</sup>):  $5.28e+10$
  - Avg Dose Rate (rad/s): 33.5
  - Start Time of Last Run: 5/15/2024 10:18:05
- Run Progress:** A progress bar is shown at 7% completion, with "Pause" and "Stop" buttons.
- Actions:** A grid of control buttons including "New File", "Close File", "Run Settings", "Ratio", "About", "File Setup", "View Printout", "Leakage", "Start Run", and "Exit".
- Status:** A text box at the bottom left indicates the machine is "Irradiating...".
