
dRICH RDO for ePIC

Davide Falchieri (INFN Bologna)
on behalf of the dRICH Collaboration

ePIC Collaboration Meeting, Lehigh University, 25 July 2024

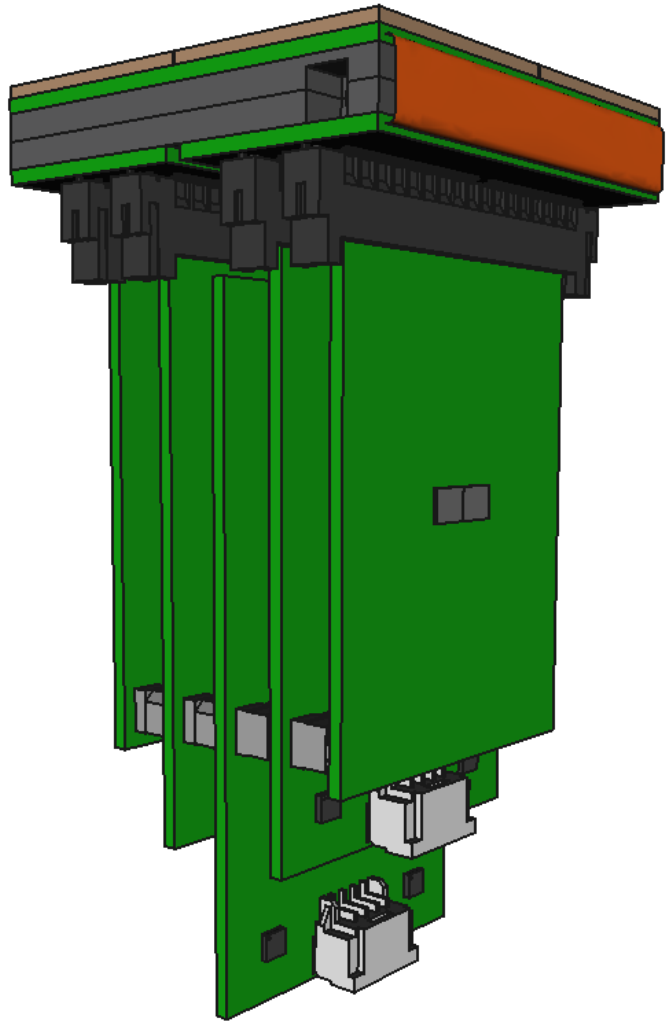
dRICH RDO overview

RDO is as a component of the dRICH PDU

basic RDO specs:

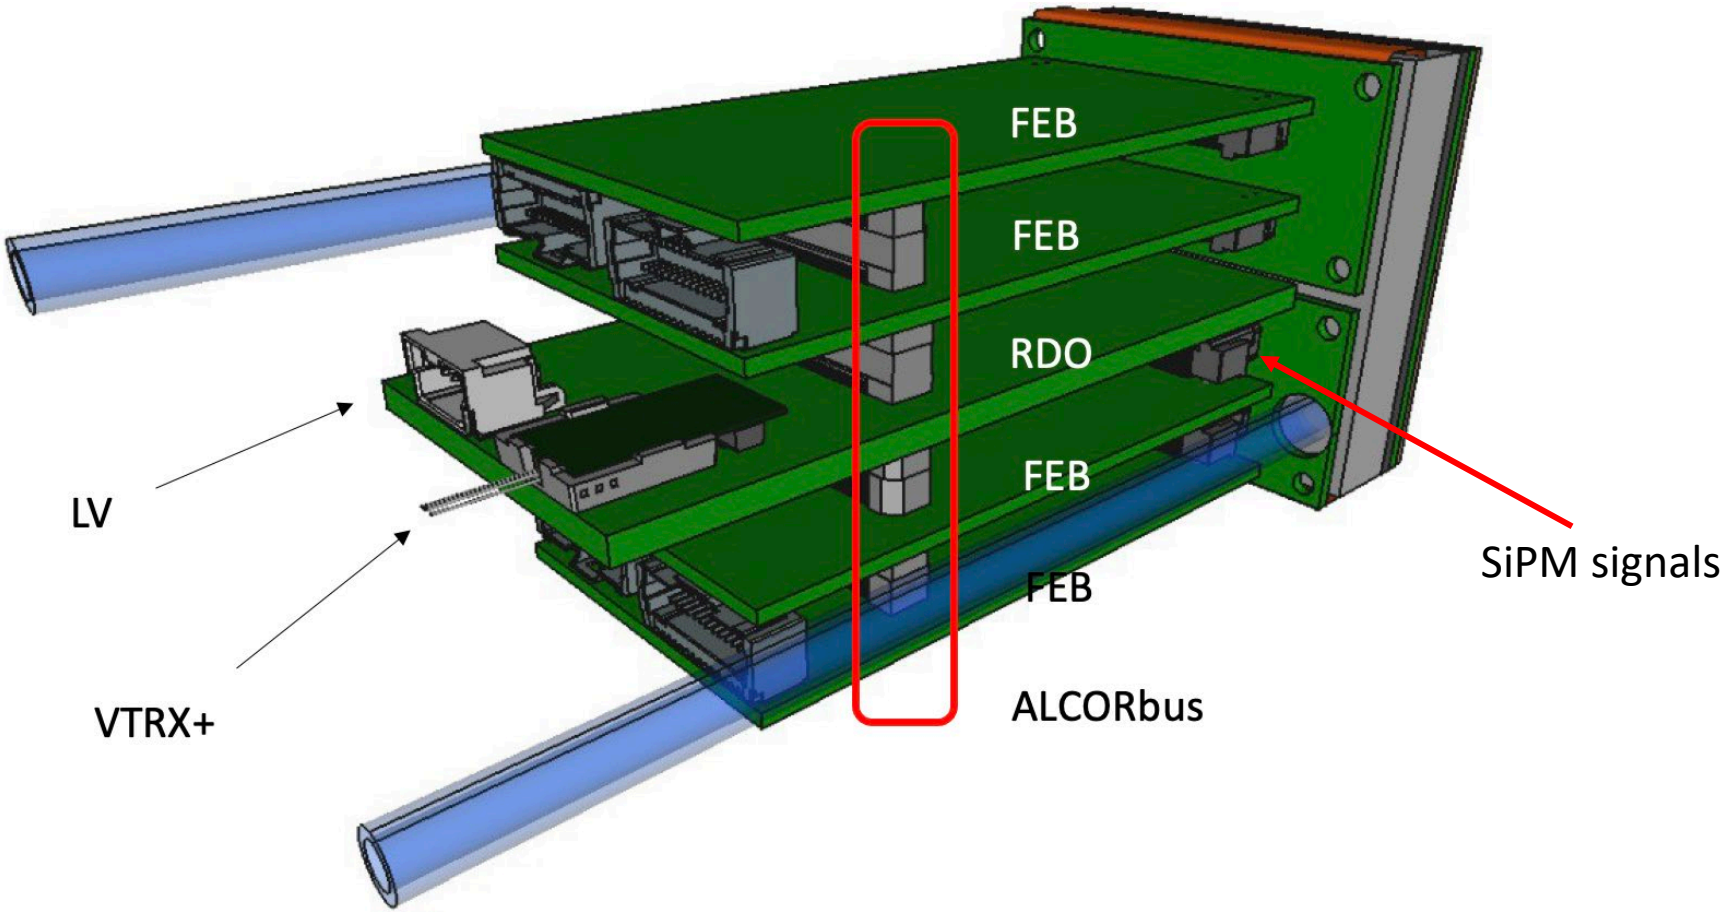
- provides interface to ePIC DAQ
- provides readout/config to 4 Alcor64 (or 8 Alcor32)
- 1 optical link (TX/RX)
- services (temperature sensors, current monitor, …)
- **4 x 9 cm^2 surface available**

Photo Detector Unit

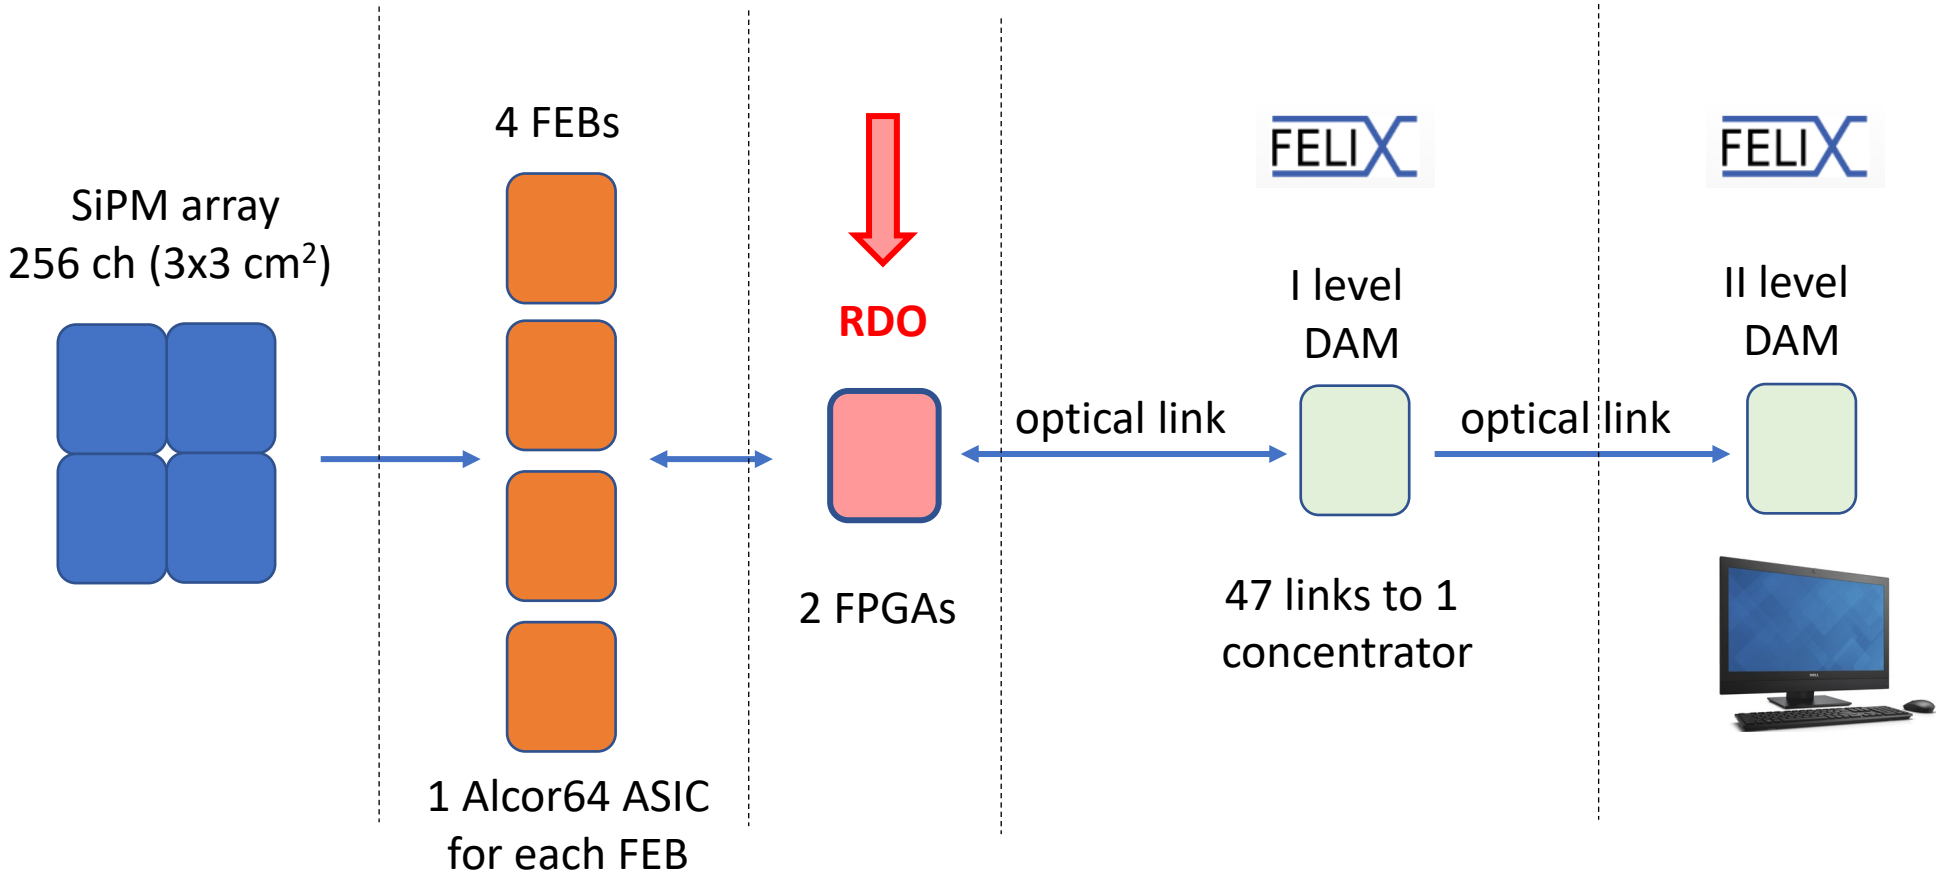


RDO

dRICH RDO overview



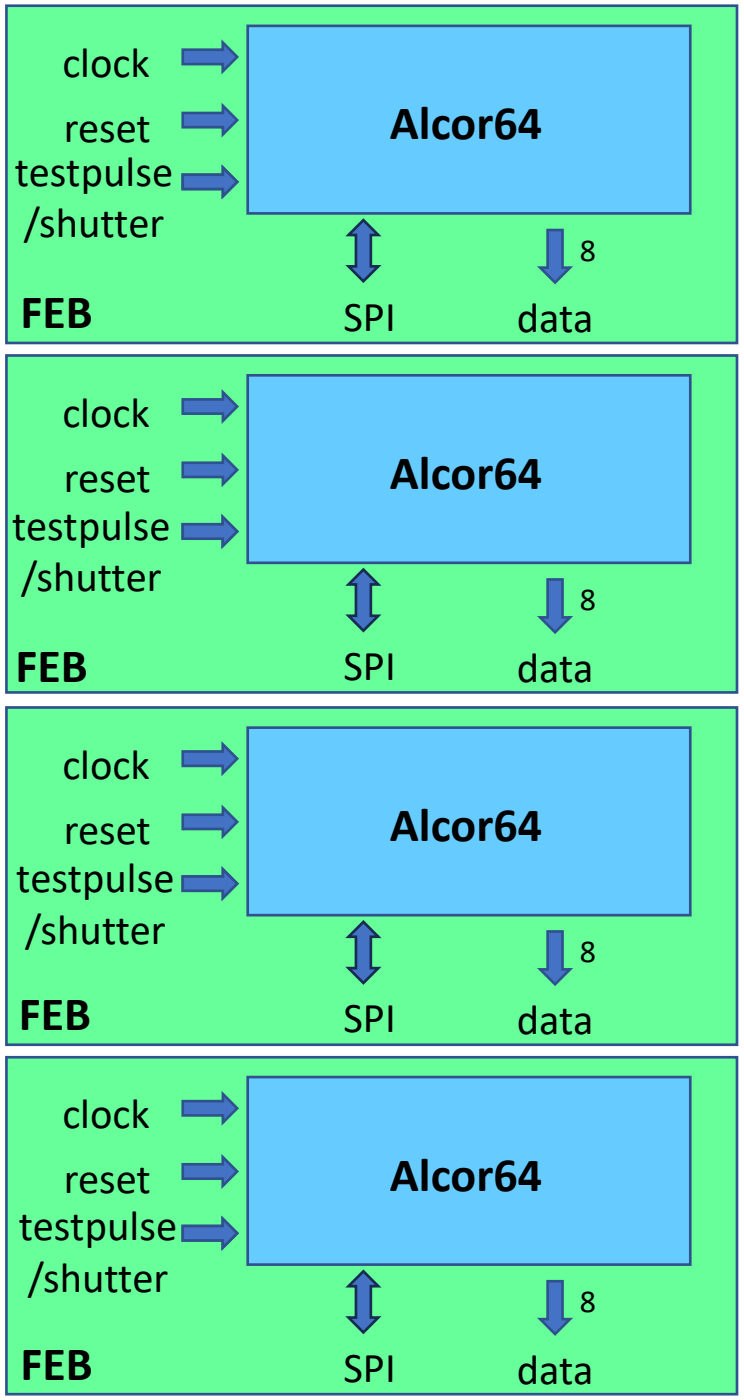
Readout concept

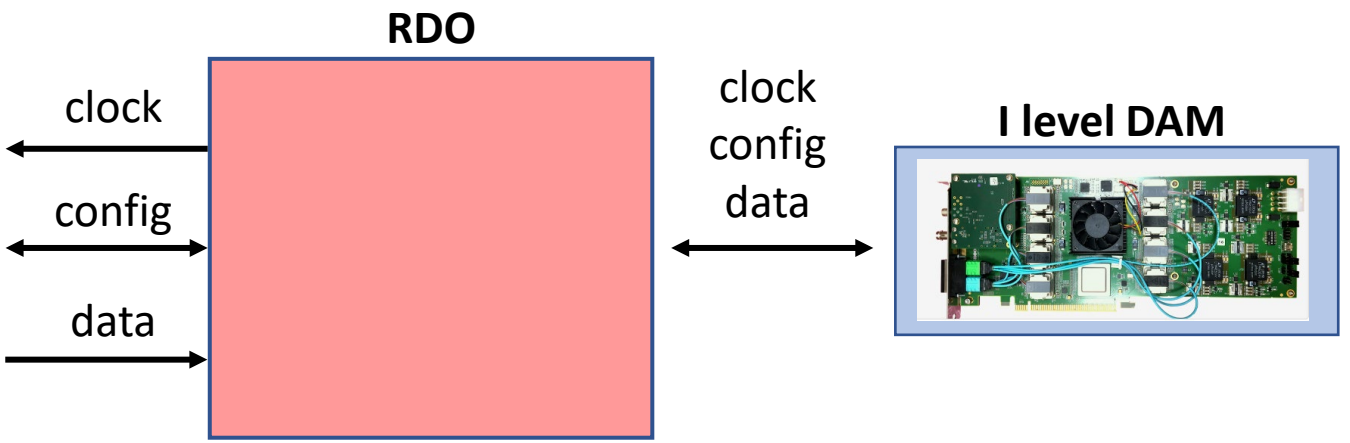


The RDO board has to:

- receive and distribute to the FEBs the common clock (394 MHz)
- manage the readout of 4 Alcor64 (64 channels each)
- send data towards the ePIC DAQ

Readout concept: 4 Alcor64





clock

data

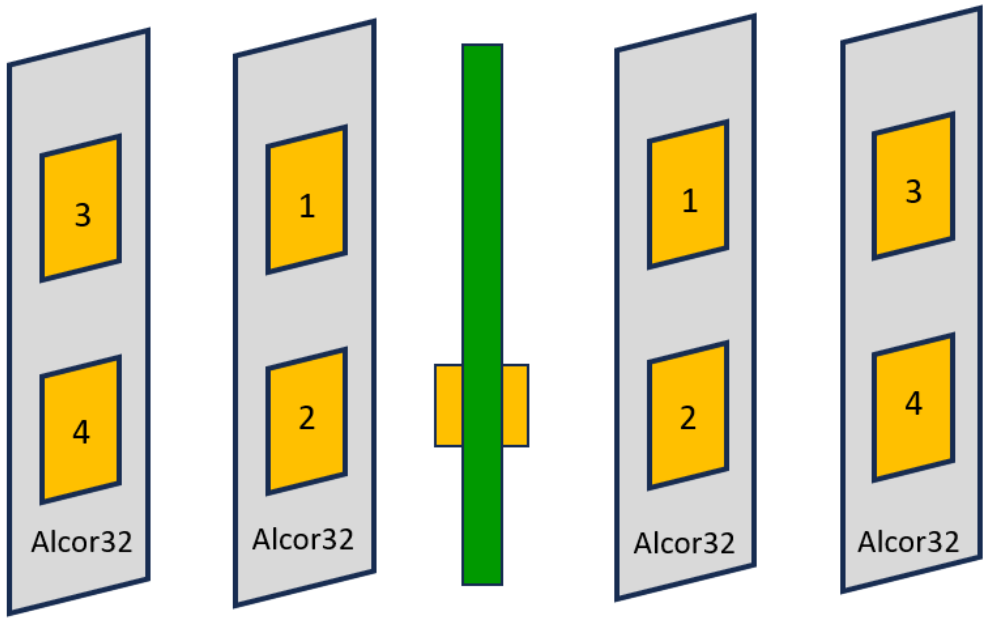
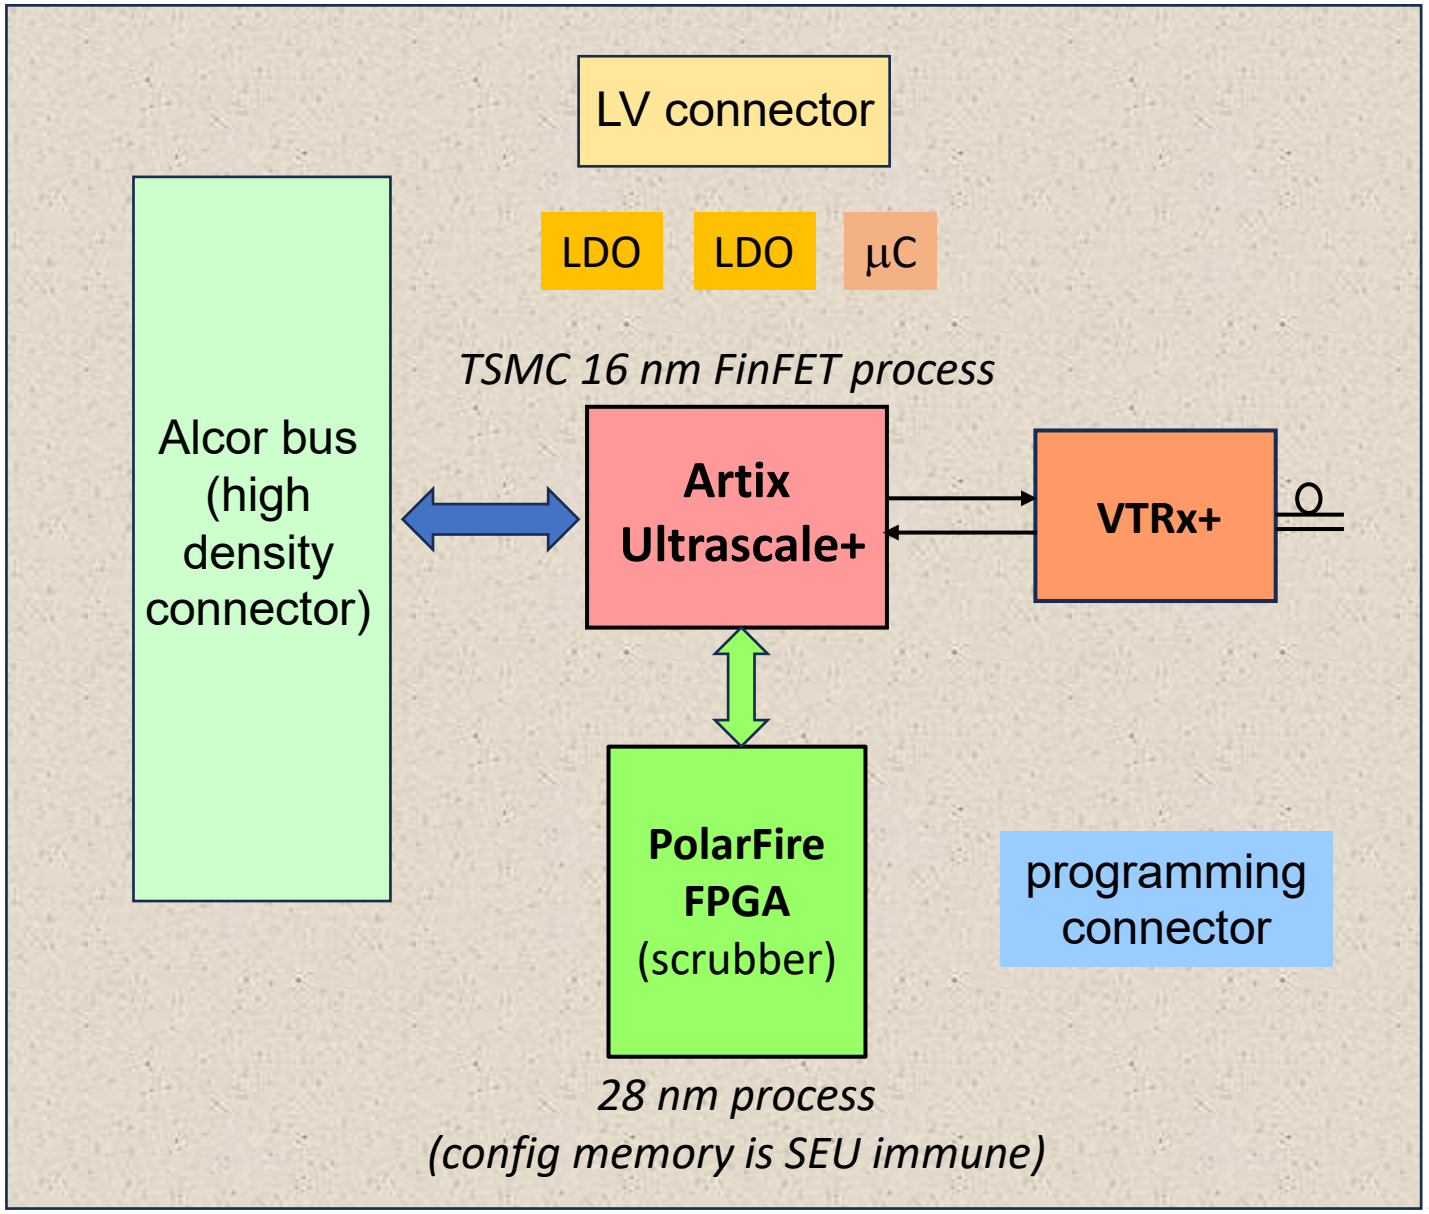
data

320 MHz

4 x 8 data lines at 320 MHz DDR



dRICH RDO architecture



The real challenge for the dRICH RDO design is to fit in **a very limited size**, quite similar to a credit card

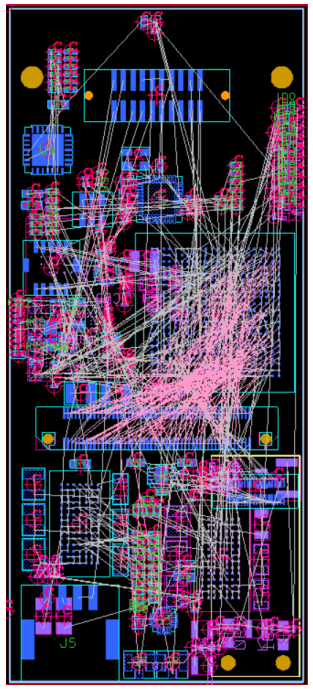
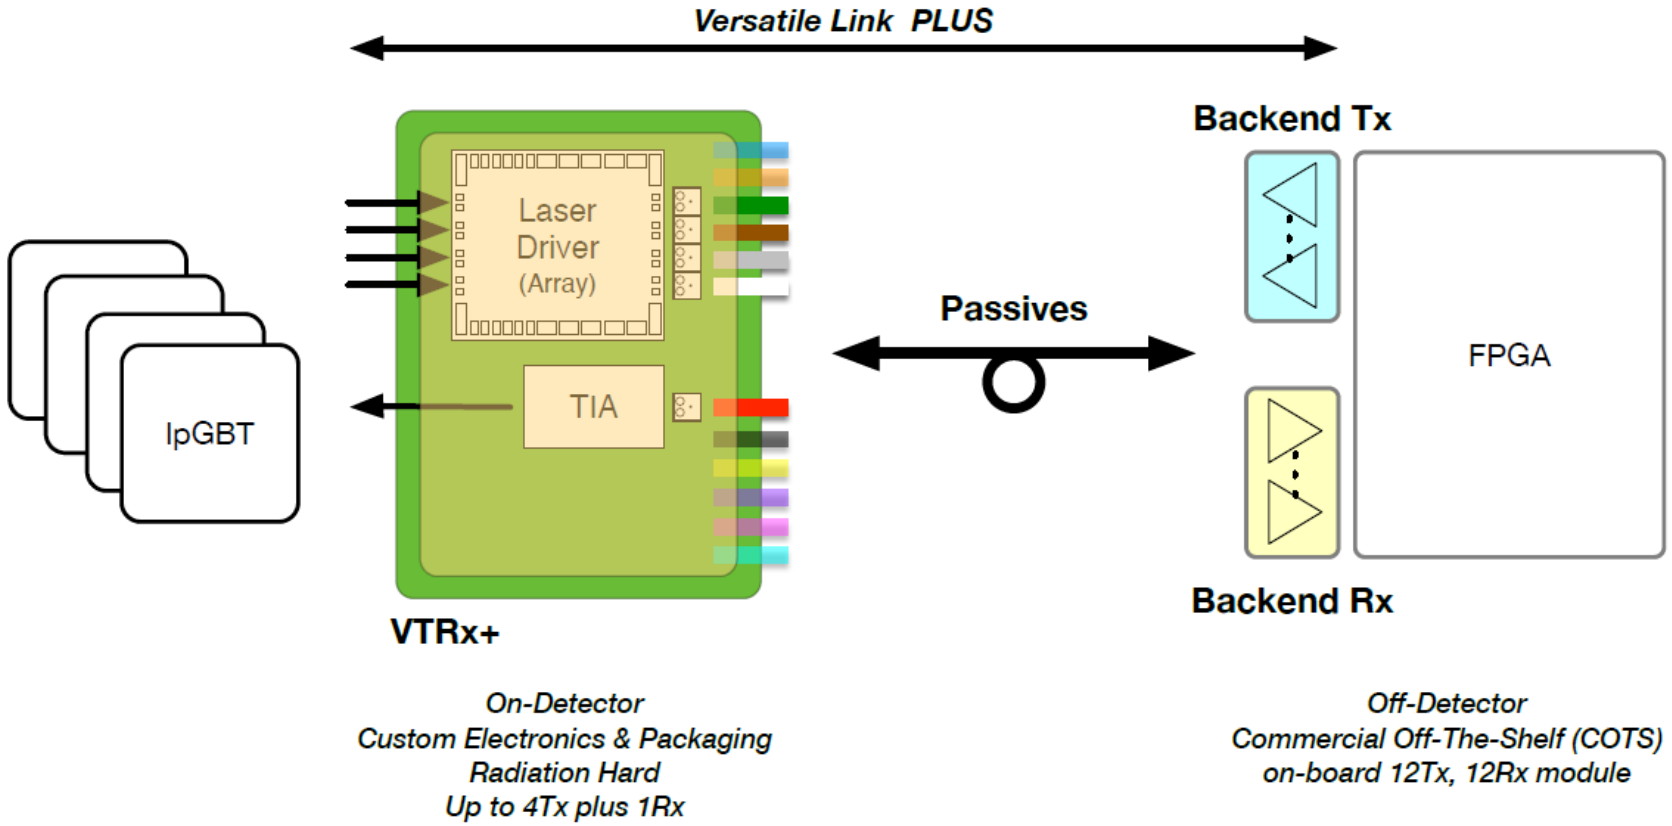
nets to route



The routing of all the signals is going to be a nightmare: 16-18 layers foreseen at minimum

Optical transceiver: VTRx+

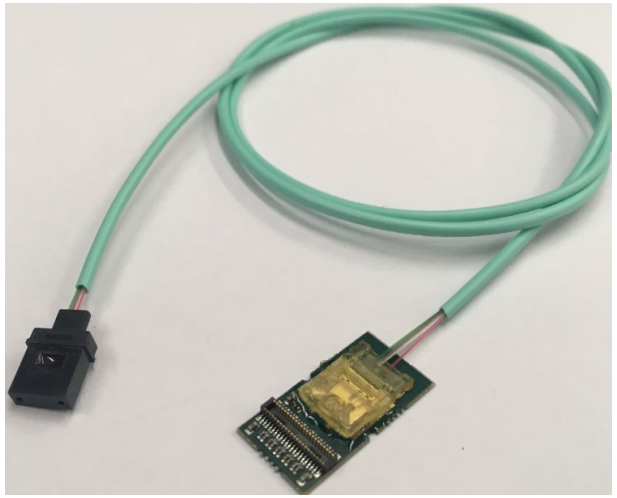


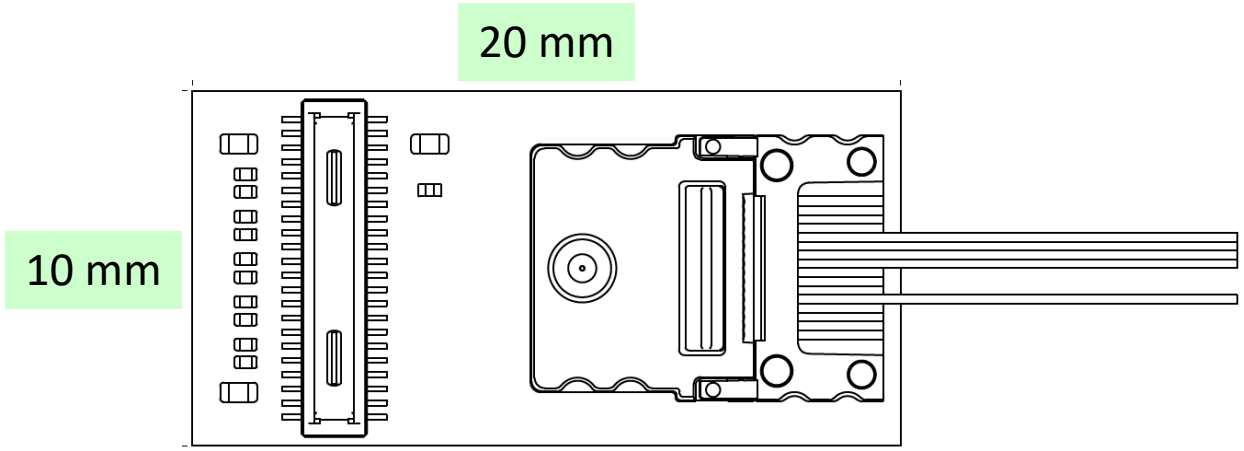
The Versatile Link+ (VL+) is a bi-directional digital optical data link with up to four upstream channels operating at up to **10.24 Gb/s** and one downstream channel operating at **2.56 Gb/s**. It is targeted to operate with the Low-power GigaBit Transceiver (lpGBT) serializer/deserializer chip at the front-end and with a lpGBT core instantiated in an FPGA at the back-end.

Optical transceiver: VTRx+

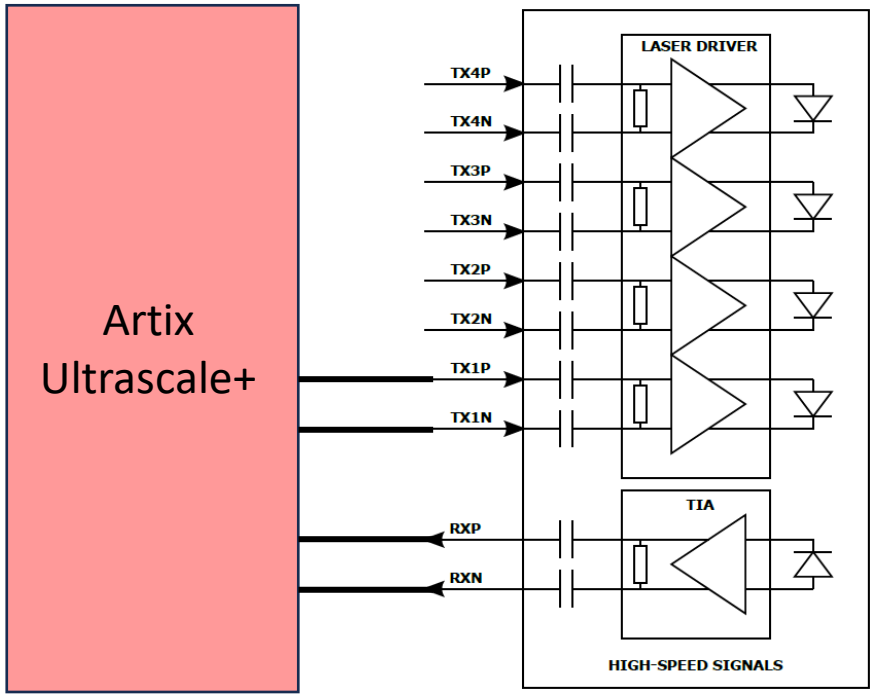
The front-end VTRx+ must withstand radiation, operate in a magnetic field and in many cases be as small and light-weight as possible

female MT connector

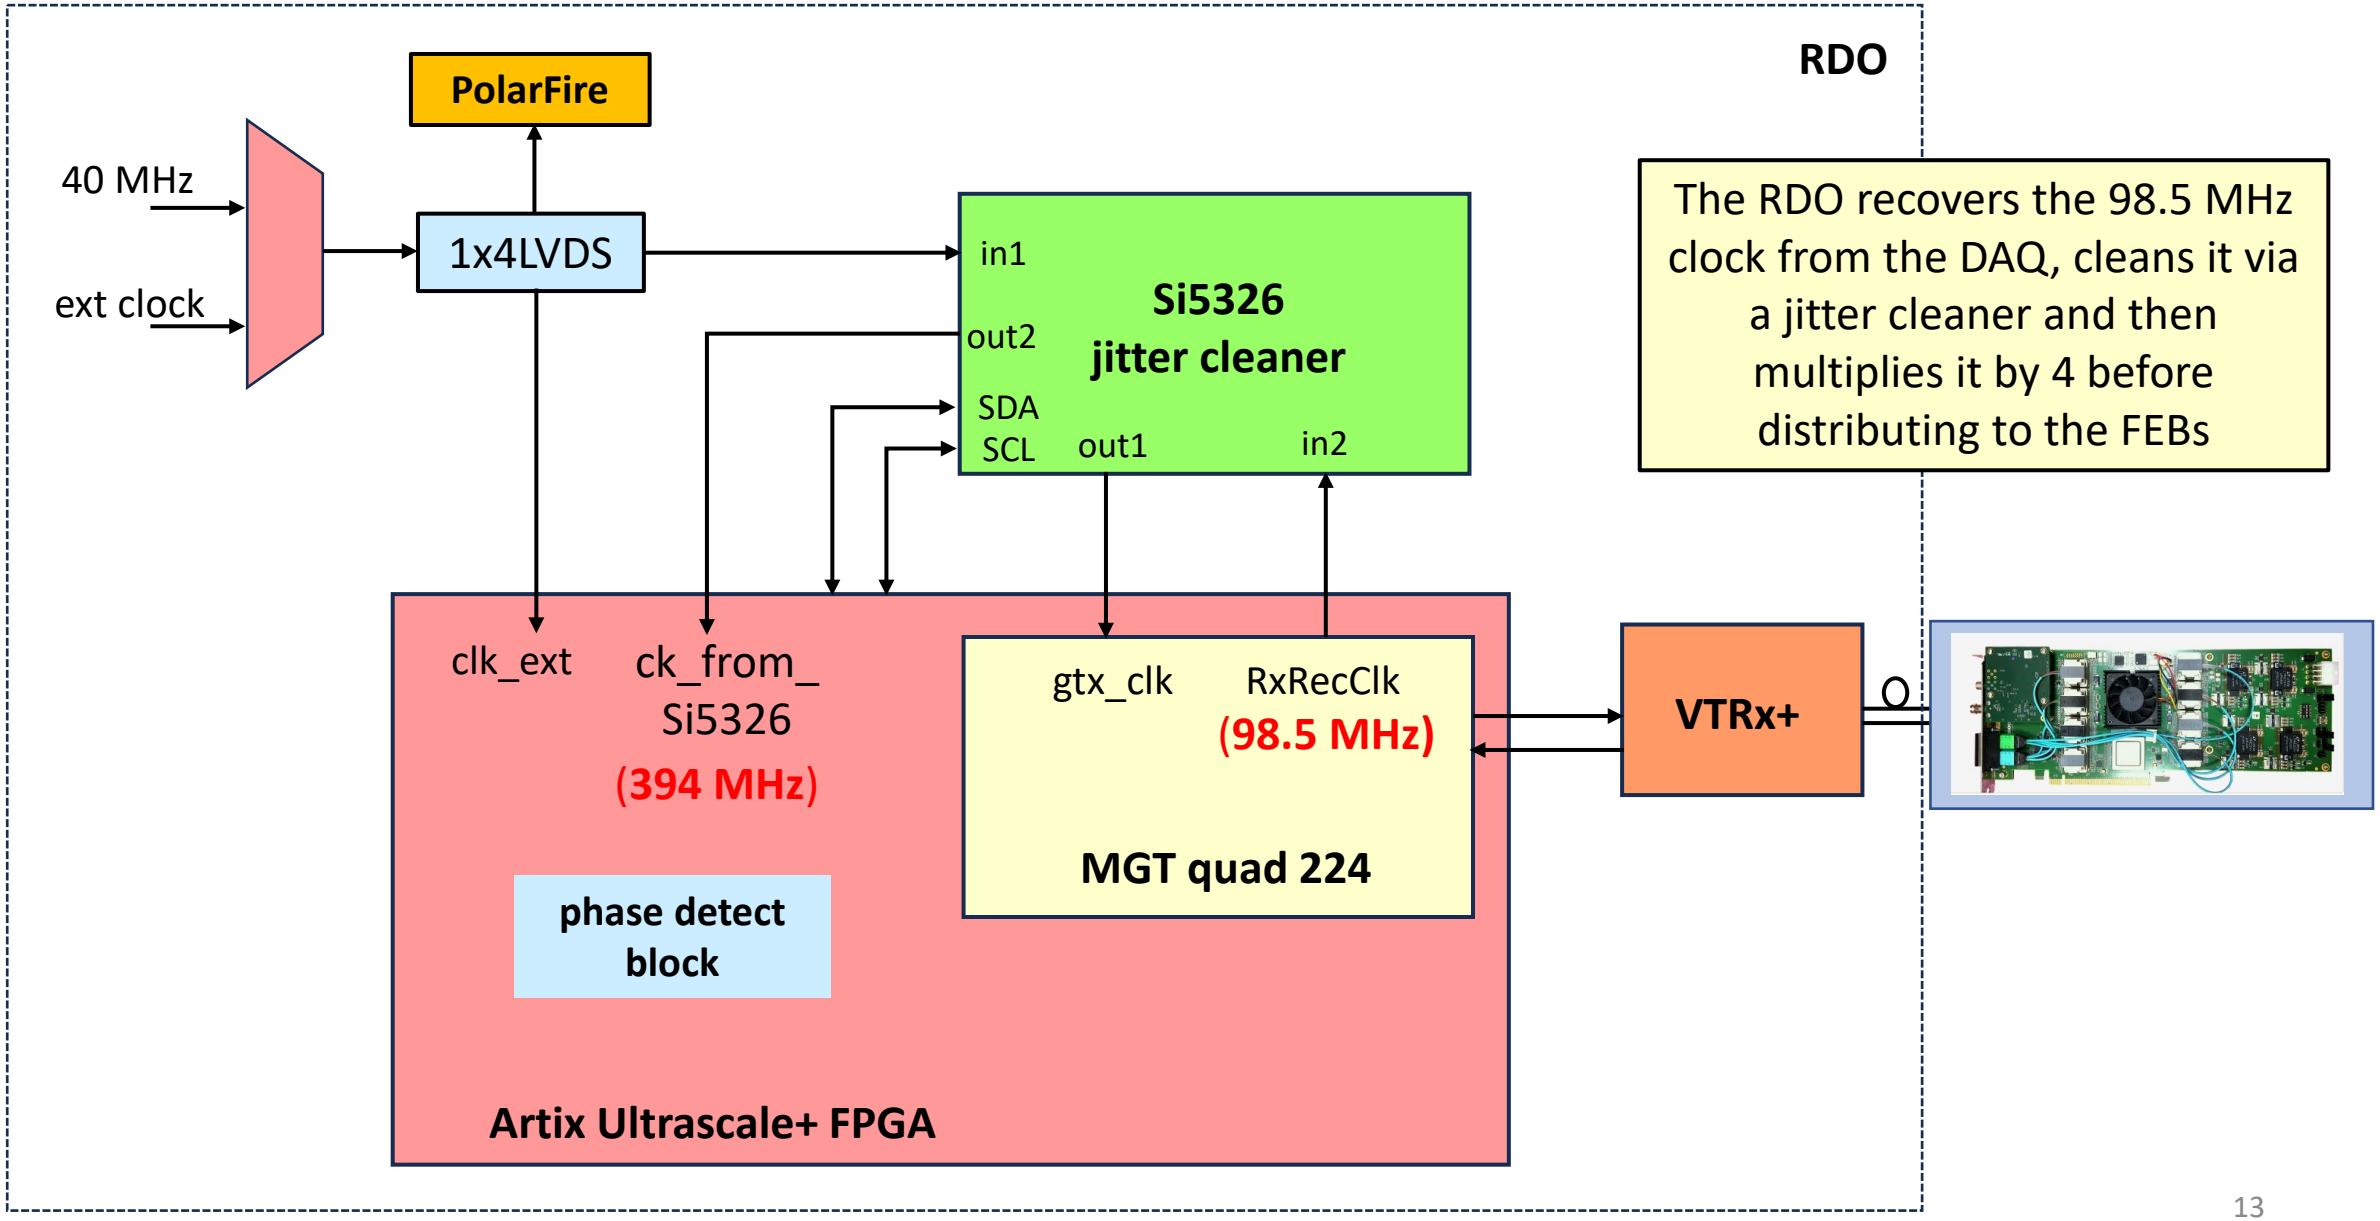




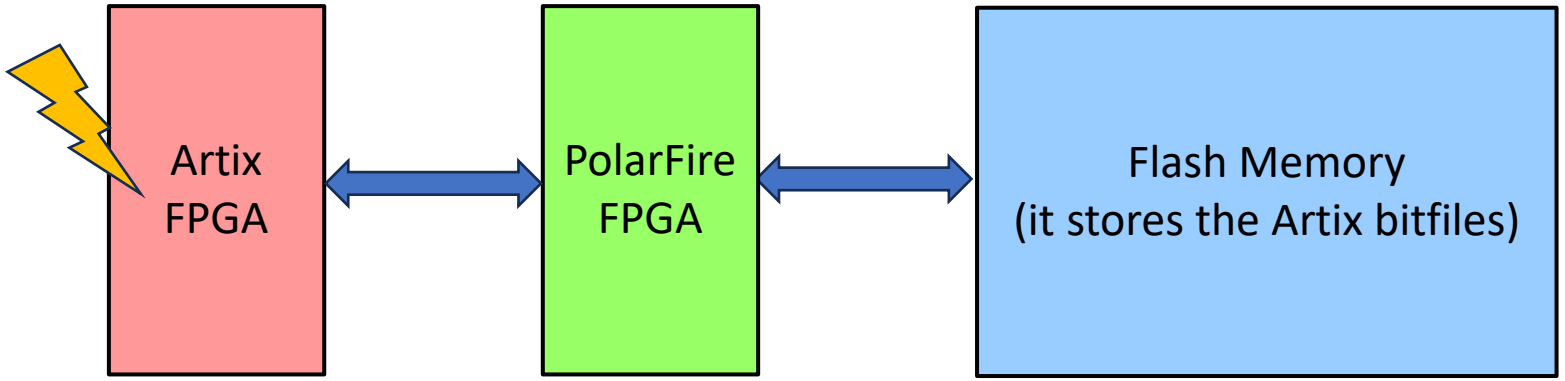
Standard Grade	1 MGy 1.7×10^{14} neutrons/cm^2 1.7×10^{14} hadrons/cm^2
Extended Grade	1 MGy 1×10^{15} neutrons/cm^2 1×10^{15} hadrons/cm^2

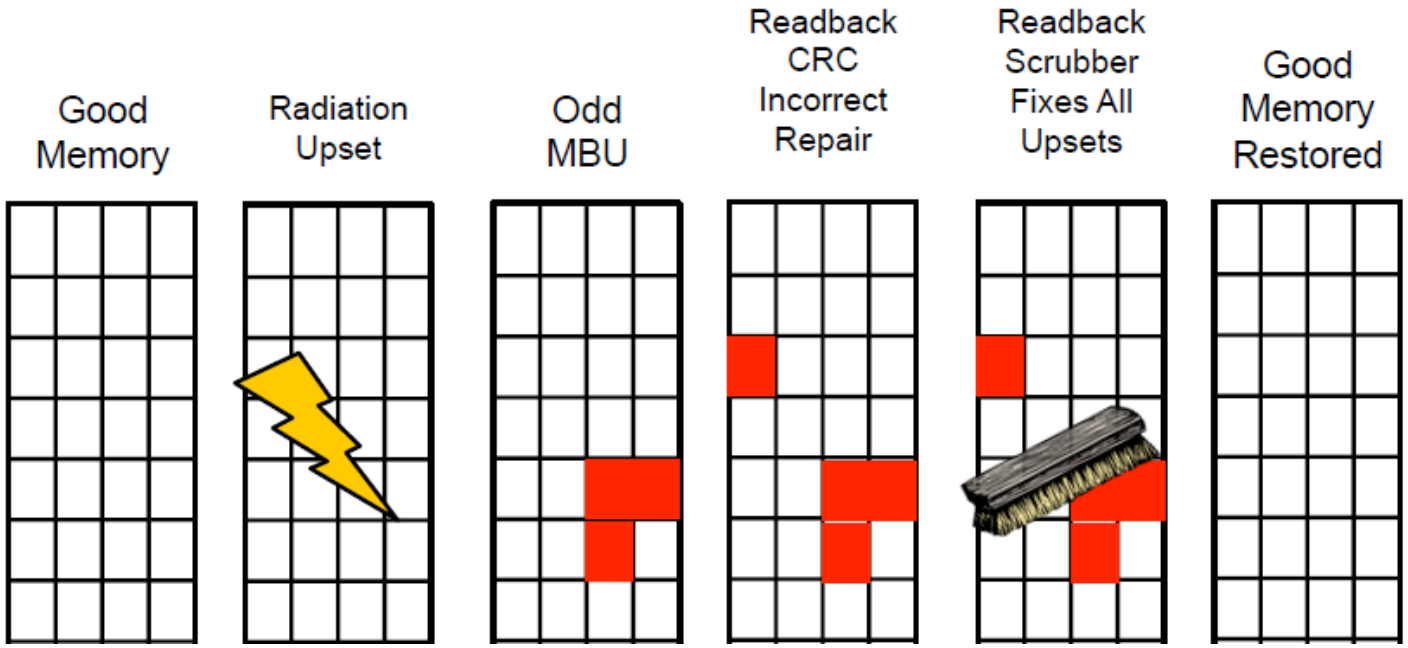


Clock distribution scheme



SRAM based FPGA configuration memory: scrubbing



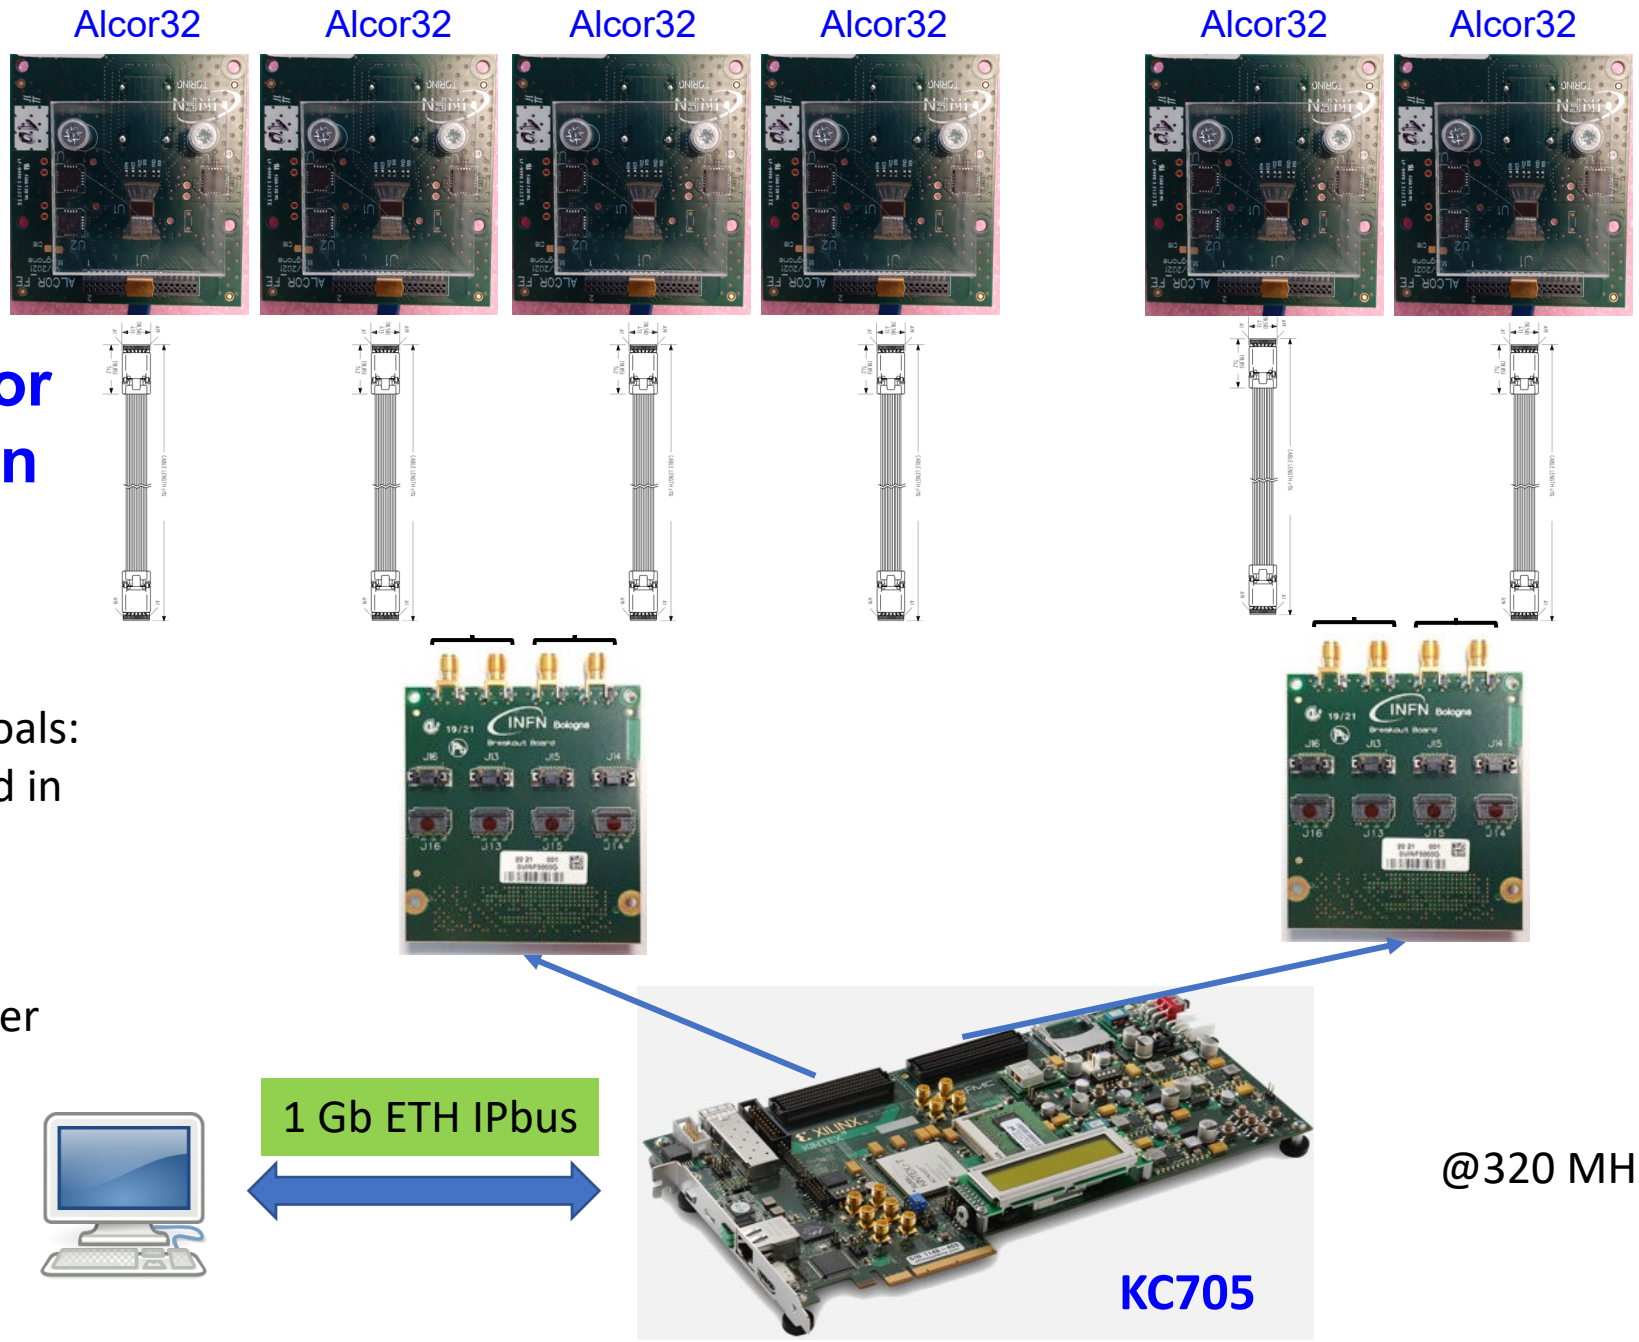


Scrubbing can be done with an internal device (like **Soft Error Mitigation IP**) or an external rad-tol device: we are using a Microchip PolarFire FPGA for the job

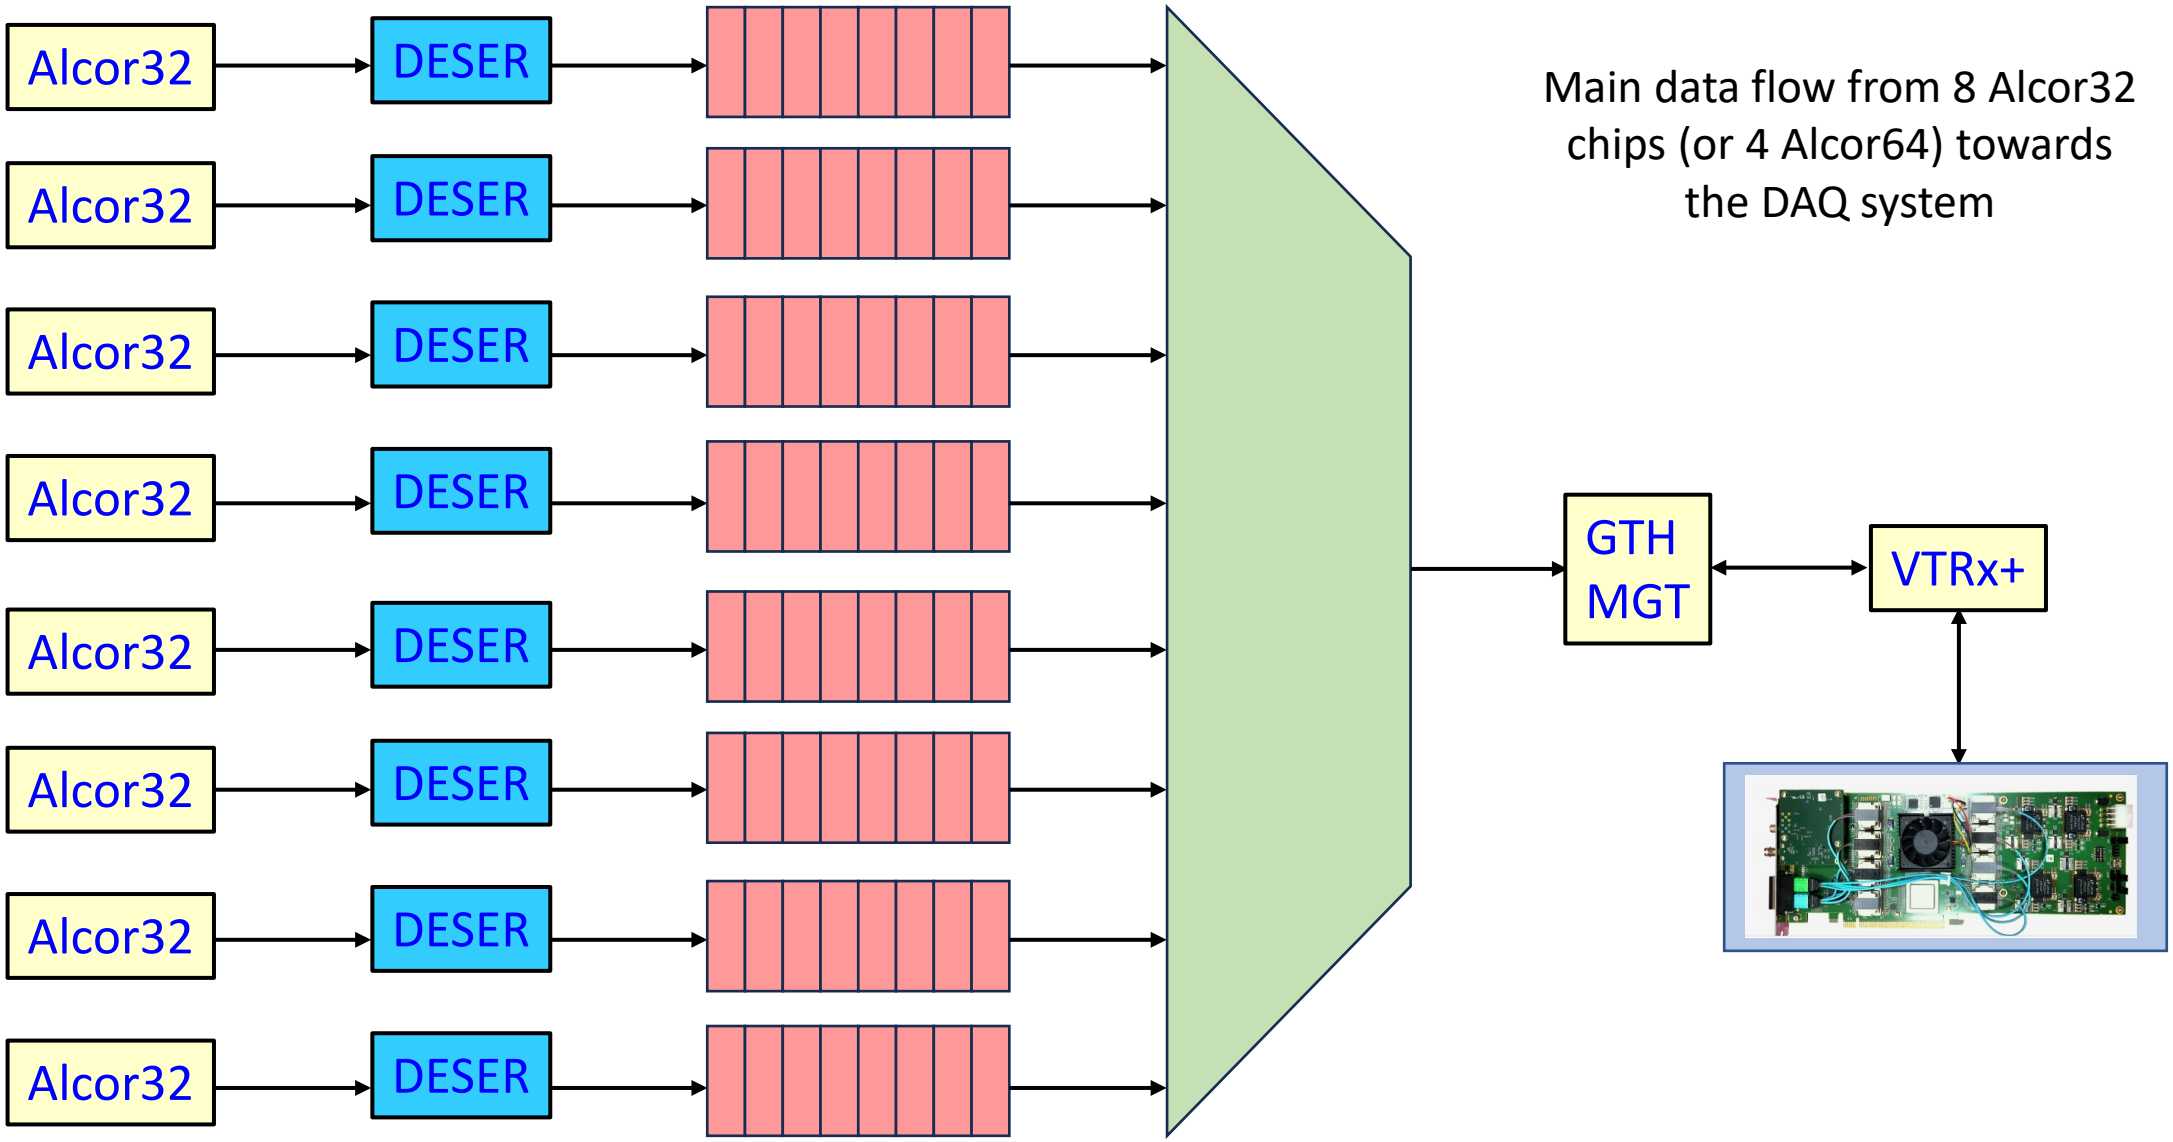
Starting point for RDO firmware design

A first firmware for the Artix Ultrascale+ (starting from the KC705 firmware) has ben developed with the following goals:

- validate the pinout used in the schematics
- validate the FPGA performances
- estimate the FPGA power consumption



Firmware design for RDO



Main data flow from 8 Alcor32 chips (or 4 Alcor64) towards the DAQ system

Timing summary @ 400 MHz

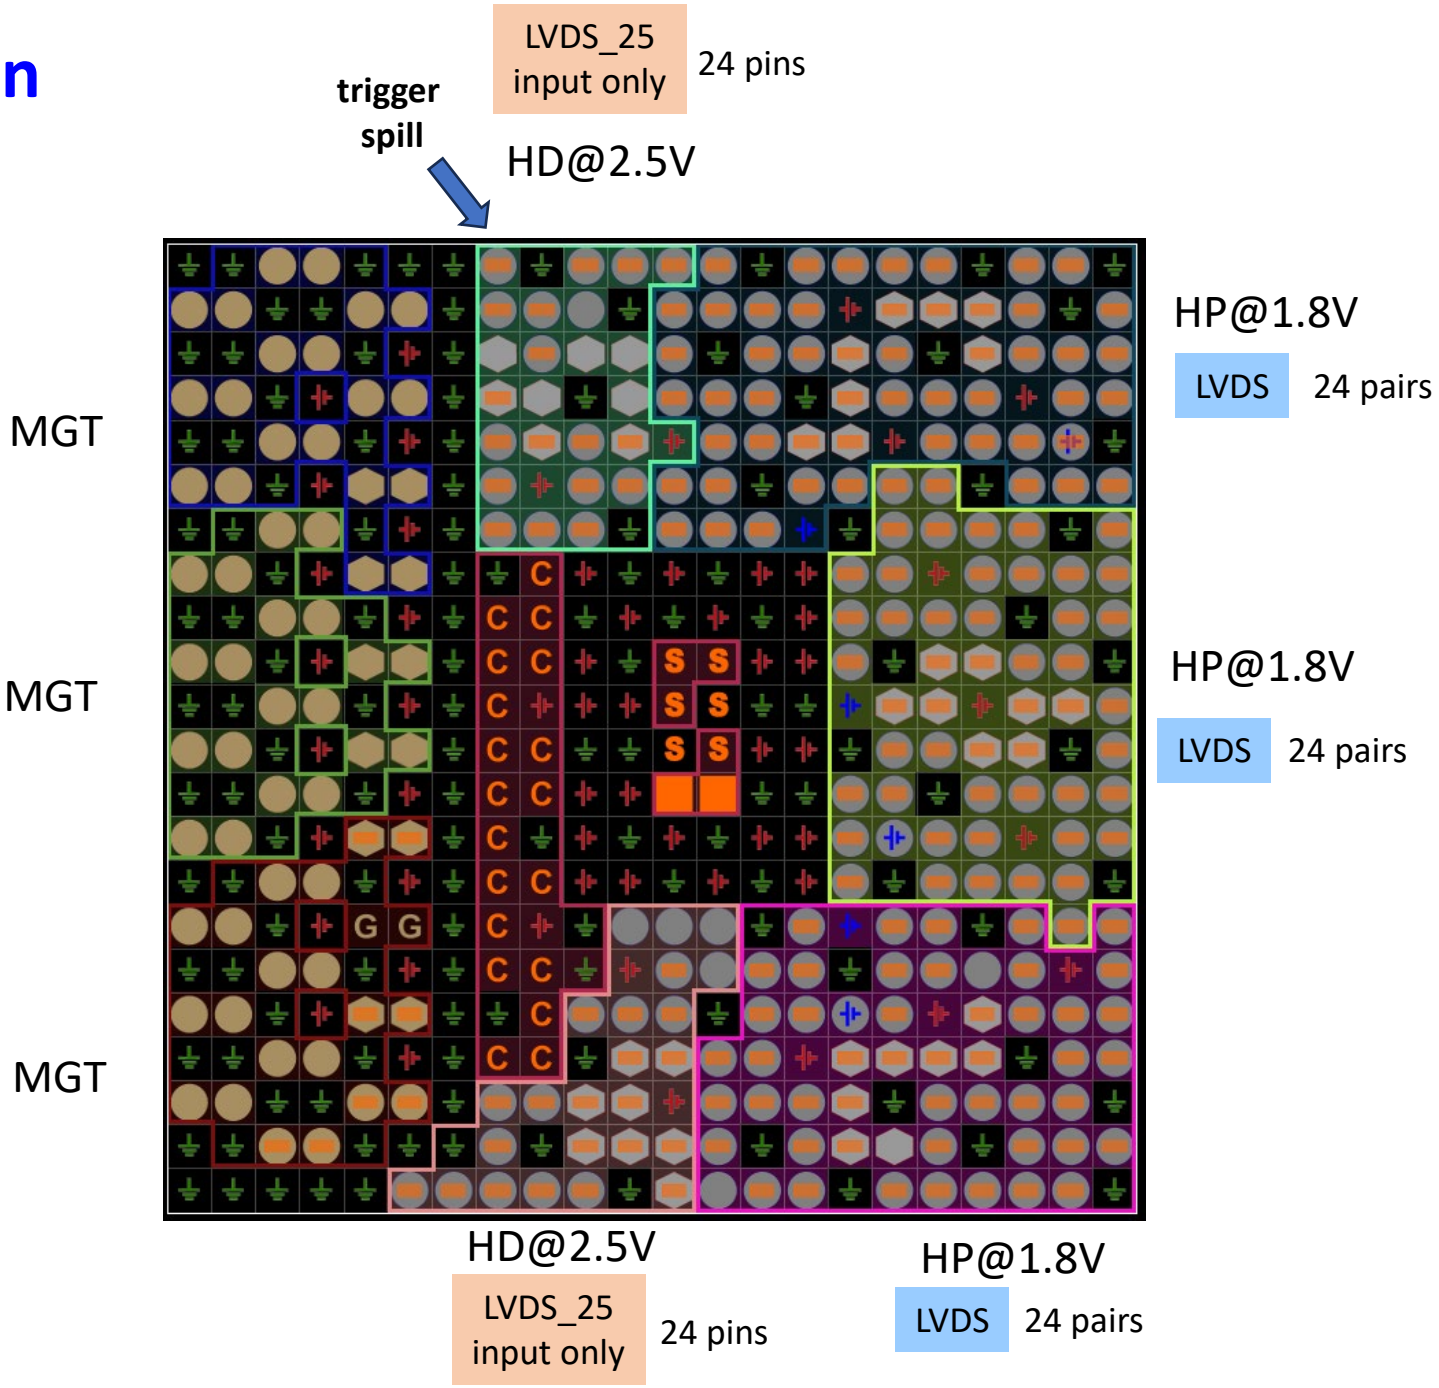
Design Timing Summary

Setup		Hold		Pulse Width	
Worst Negative Slack (WNS):	0.385 ns	Worst Hold Slack (WHS):	0.010 ns	Worst Pulse Width Slack (WPWS):	0.250 ns
Total Negative Slack (TNS):	0.000 ns	Total Hold Slack (THS):	0.000 ns	Total Pulse Width Negative Slack (TPWS):	0.000 ns
Number of Failing Endpoints:	0	Number of Failing Endpoints:	0	Number of Failing Endpoints:	0
Total Number of Endpoints:	70995	Total Number of Endpoints:	69295	Total Number of Endpoints:	35268

All user specified timing constraints are met.

Firmware was validated also @ 400 MHz

Pinout validation

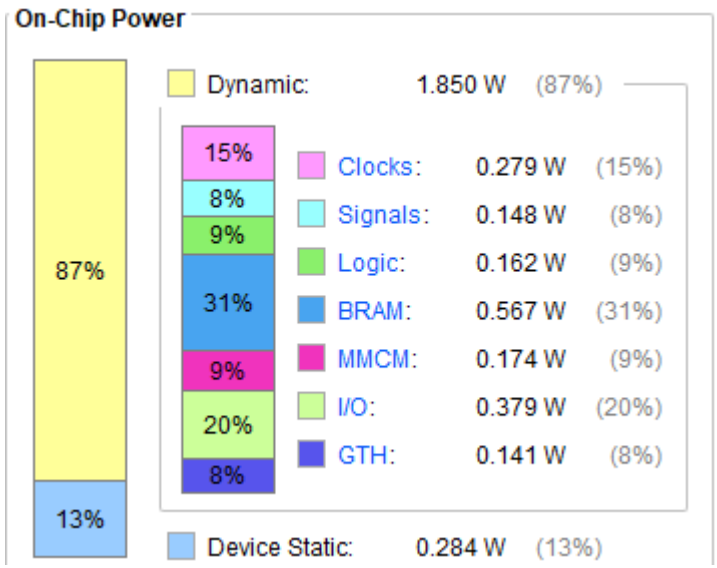


Power consumption @ 400 MHz

Summary

Power analysis from Implemented netlist. Activity derived from constraints files, simulation files or vectorless analysis.

Total On-Chip Power:	**2.134 W**
Design Power Budget:	**Not Specified**
Power Budget Margin:	**N/A**
Junction Temperature:	**30.8°C**
Thermal Margin:	69.2°C (24.8 W)
Effective ϑJA:	2.7°C/W
Power supplied to off-chip devices:	0 W
Confidence level:	Low



Power Supply

Supply Source	Voltage (V)	Total (A)	Dynamic (A)	Static (A)	Budget (A)	Margin (A)

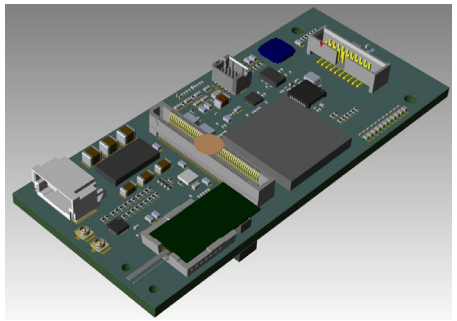
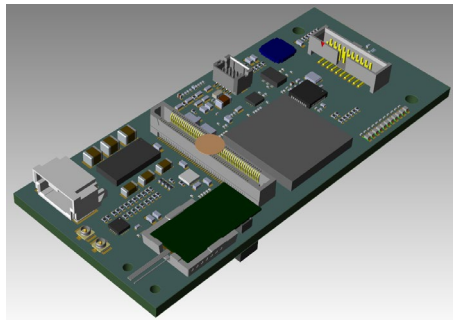
Vccadc	1.800	0.008	0.000	0.008	Unspecified	NA
MGTAVcc	0.900	0.039	0.030	0.009	Unspecified	NA
MGTAVtt	1.200	0.107	0.093	0.014	Unspecified	NA
MGTVccaux	1.800	0.000	0.000	0.000	Unspecified	NA

The total RDO power consumption is ~3.5W



Status of the design and conclusions



- the schematic design of **dRICH RDO** is almost finished:
  - now performing the final checks and cross-checking the most critical parts:
    - clock distribution
    - remote programmability
- the desired placement is ready
- the PCB layout is going to start soon
- we plan to have the first prototypes ready by the end of 2024 and to do extensive debug (also the radiation tolerance will be tested)
- we are working on the firmware in the meanwhile

Thanks!

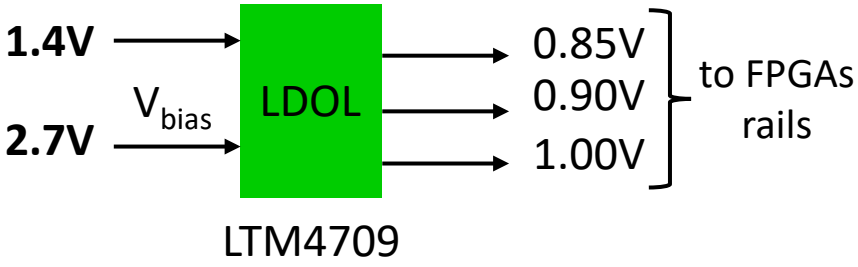
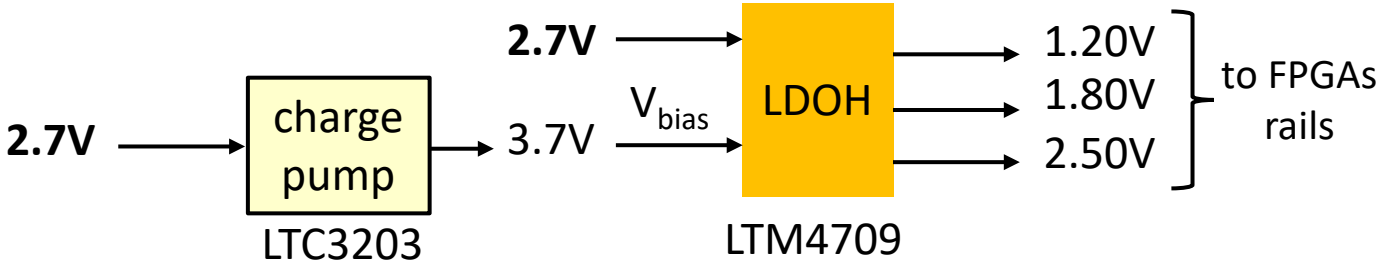
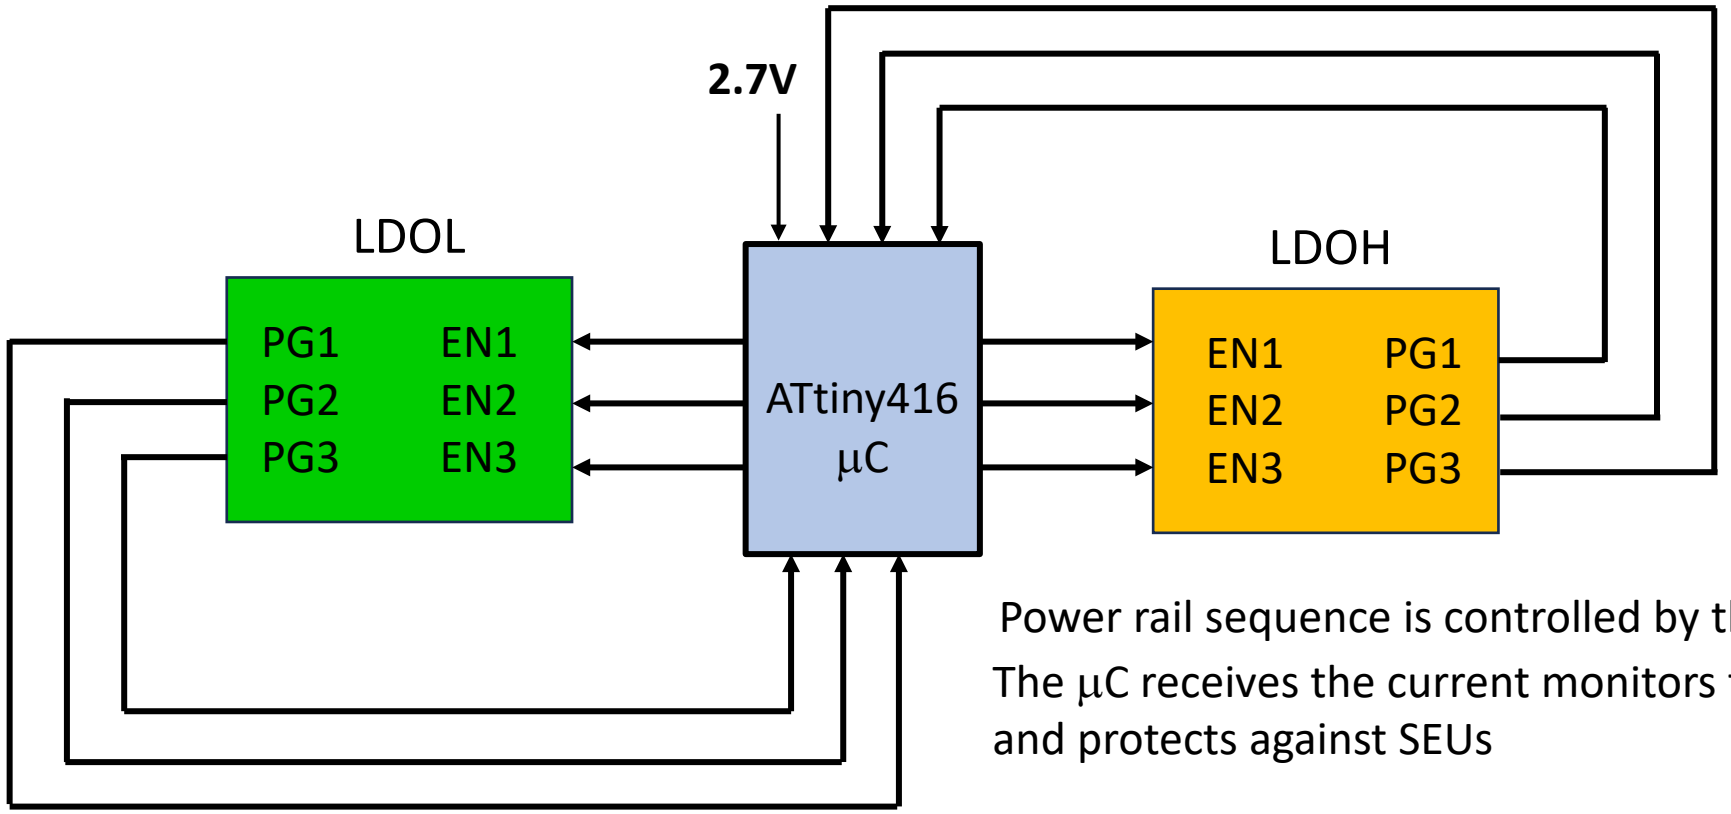
Power management





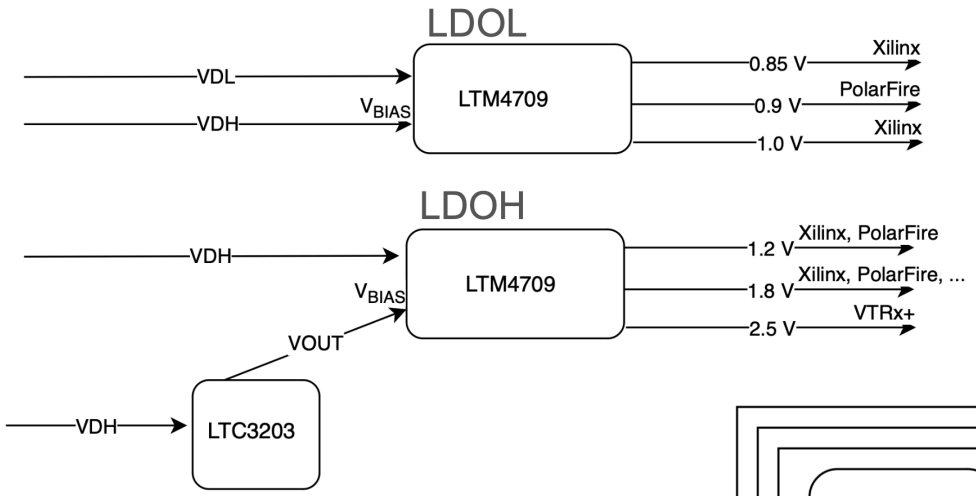


Power rail sequence is controlled by the ATtiny

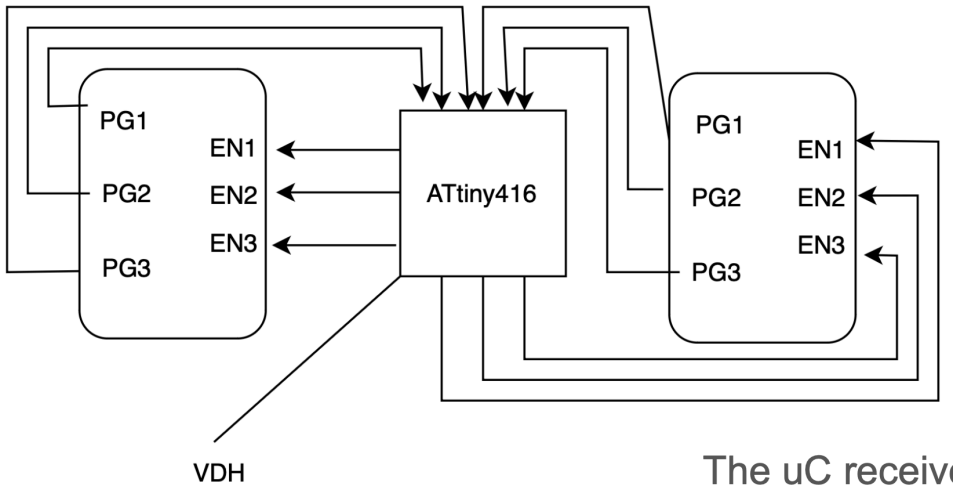
The µC receives the current monitors from the 2 LDOs and protects against SEUs

Power management

VDH: the high primary digital V: 2.7 V
VDL: the low primary digital V: 1.4 V
VOUT needs to be 3.7 V



LTC3203 https://www.analog.com/en/products/ltc3203.html



The uC receives the current monitors from the two LDOs and protect against SEL

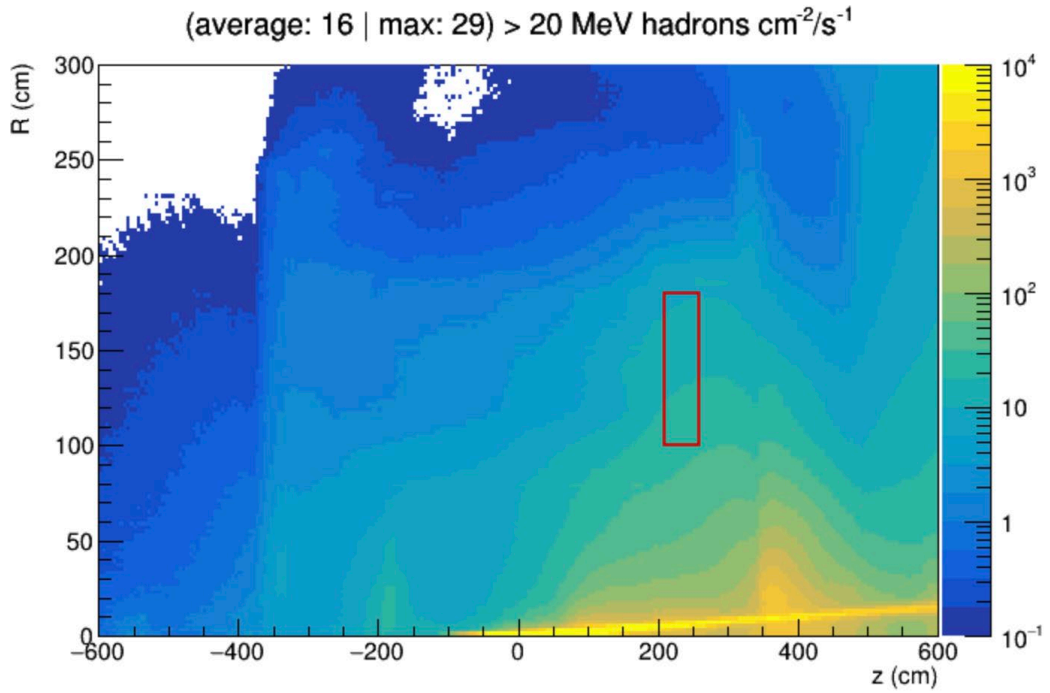
SEU rates

Xilinx declares 2.67×10^{-16} cm^2/bit cross-section for CRAM bits
AUP15 has $42.8 \times 10^{+6}$ configuration bits
dRICH flux (hadrons > 20 MeV): 200 cm^{-2}s^{-1} (safety factor: 5)



1 SEU every 4.3x105 s/FPGA

↓

1 SEU every 3.5x10^{2}s/dRICH

↓

1 SEU every 6 minutes in whole dRICH

- SEU rate (if confirmed) seems manageable
- a scrubber might not be strictly needed
- RDO final design to be validated with a full irradiation test
