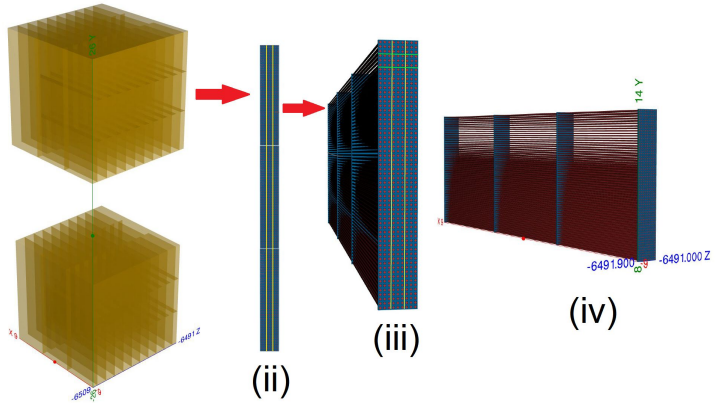
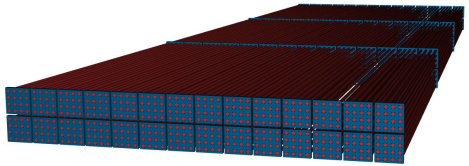
Luminosity Monitors



TDR update
Nick Zachariou



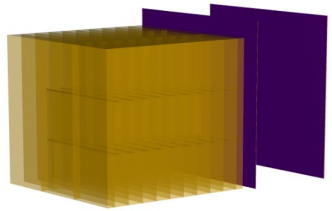
Luminosity PS/Direct Photon

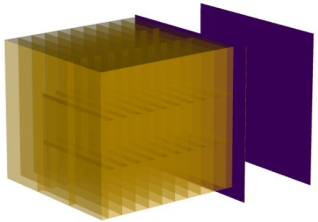
Detector Design
- Overview
- Detector requirements
- Radiation requirements
- Test beam results

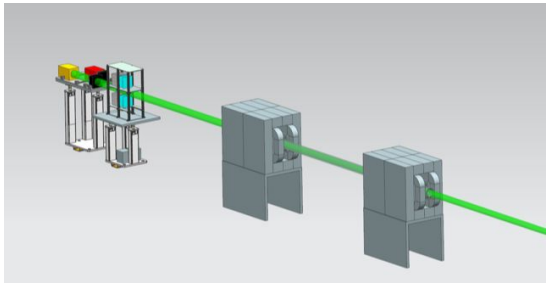
Performance
- Studies required for the detector
- Event reconstruction
- Clusterization

Mechanics and Integration
- Structure
- Support structures

Status in dd4hep
- Calorimeters
- Trackers
- Beam line components (converter/exit windows)







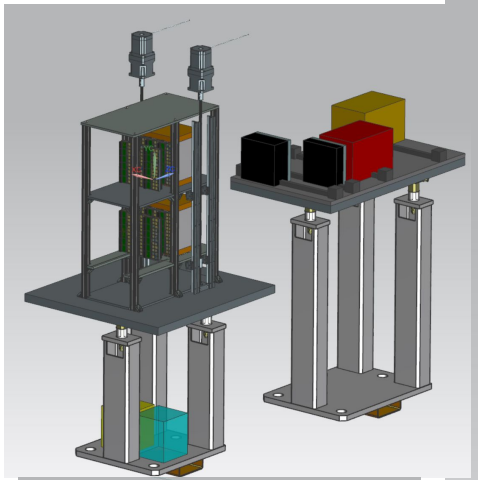
Readout
- SiPM Boards
- DAQ
- Tracker

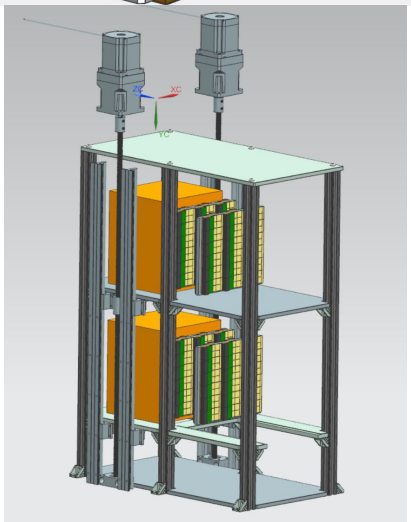
Cooling
- Tracker Cooling
- Converter cooling

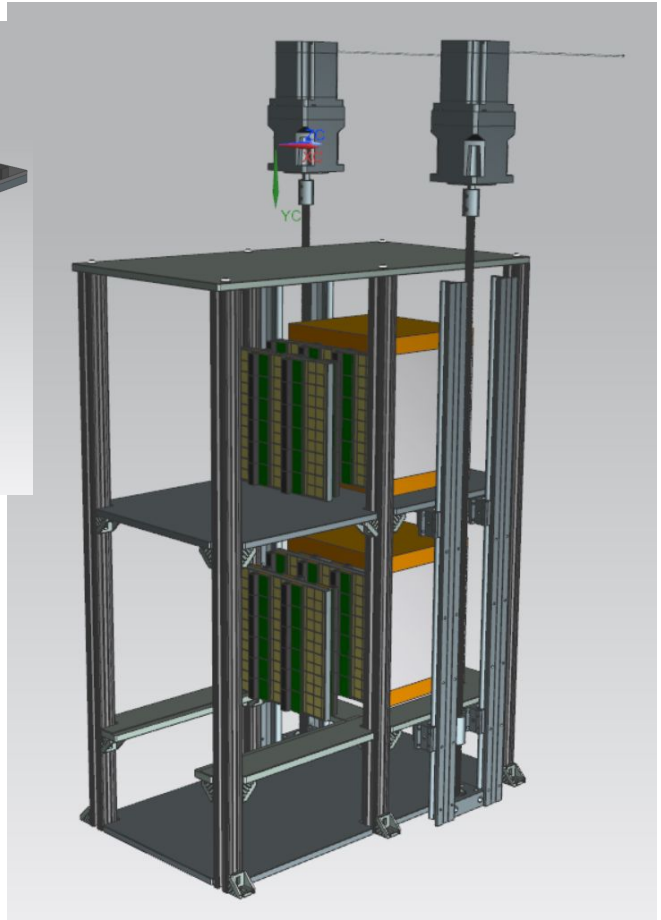
Monitoring System
- LED system
- Temperature monitoring

Ready
Work in progress
Lots to do

Lumi Integration







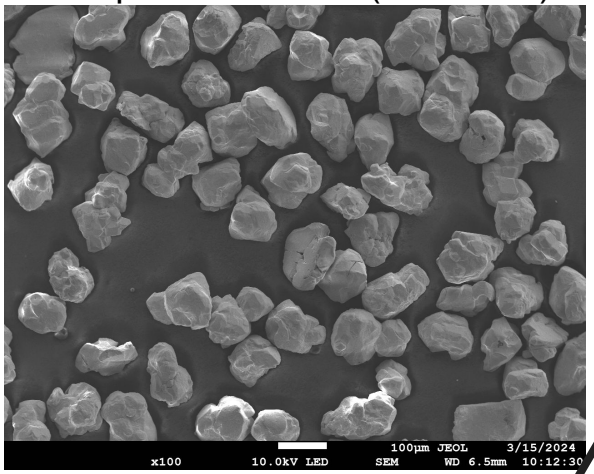
Support from JLab designers
Thanks to Yulia and Jonathan

Lumi - Calorimeter Prototyping Materials

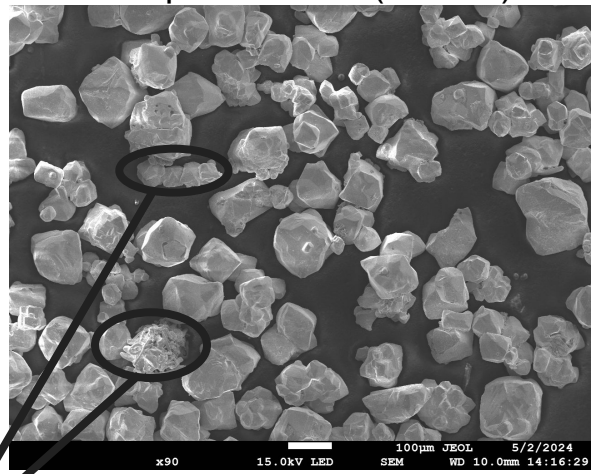
Equipment needed for prototype construction acquired

- Epoxy
- Fibres
  - Kurraray sample
  - Mi-Net (luxium) sample
- W Powder samples
  - sPHENIX sample from China
  - New US supplier, Buffalo Tungsten
- SiPMs - Delivered
- Construction moulds/meshes in place

Sample from China (sPHENIX)



Sample from US (Buffalo)



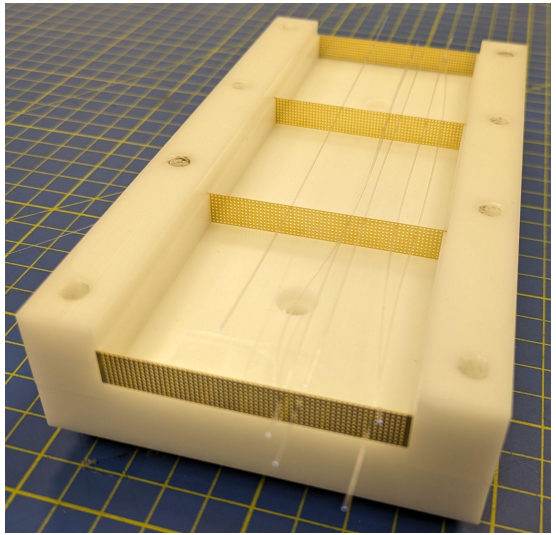
- Similar grain sizes (~100 µm)
- Some non-uniform shapes/grains in Buffalo Tungsten sample

Lumi Calorimeter - Calorimeter Module Moulds

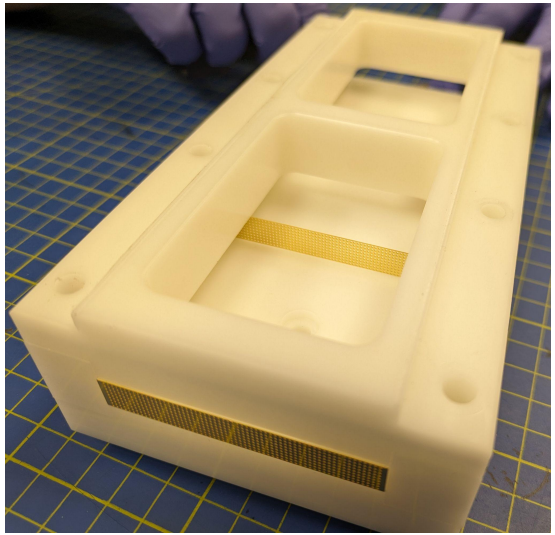
Moulds for module construction created

- First iteration machined at the University of York
- Need to feed fibres through mesh, slot into mould
- Pour tungsten powder into top of mould
  - On vibrating table (also acquired)
- Pour epoxy
- Cure in low temperature oven

Mould with meshes and fibres in place



Mould with top in place, powder will be poured in openings



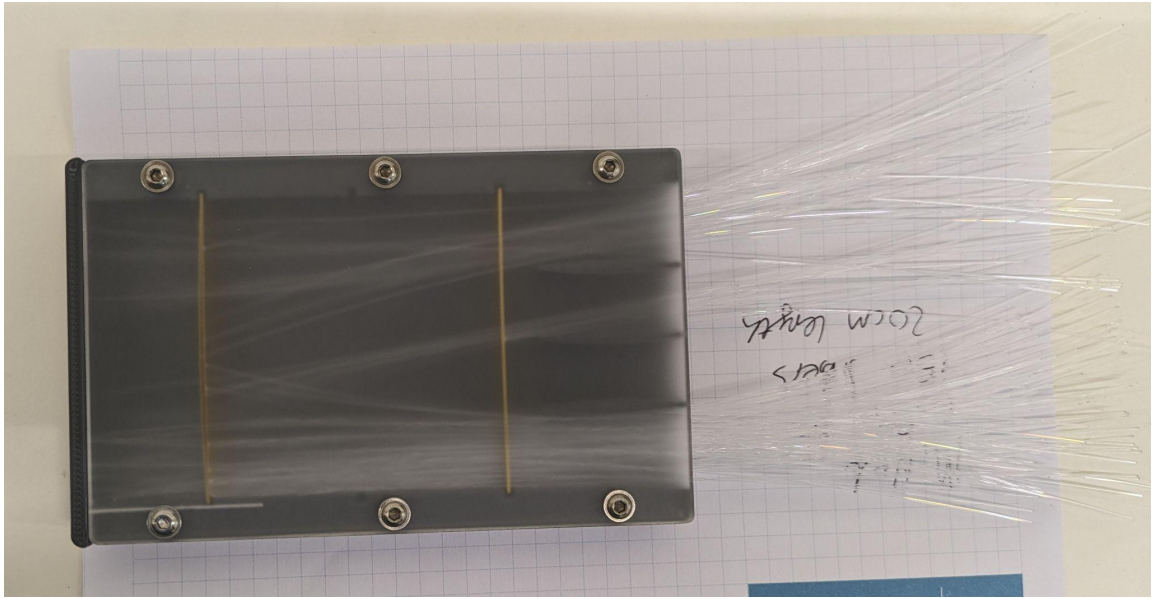
- Mesh holders for (~540) fibres slot into mould

Lumi Calorimeter - Calorimeter Fibre Holders

Need holder to feed fibres through thin brass meshes

- 3D printed first iteration of holder
- Next iteration - 4 meshes stacked
- Working relatively well so far, but need to evolve to final design quickly
- Fiddly step!

- Fibre holder with roughly 150 (out of total 540 per module) fibres fed in
- 2 meshes per slot in this design
  - New design but improvement still need to be made

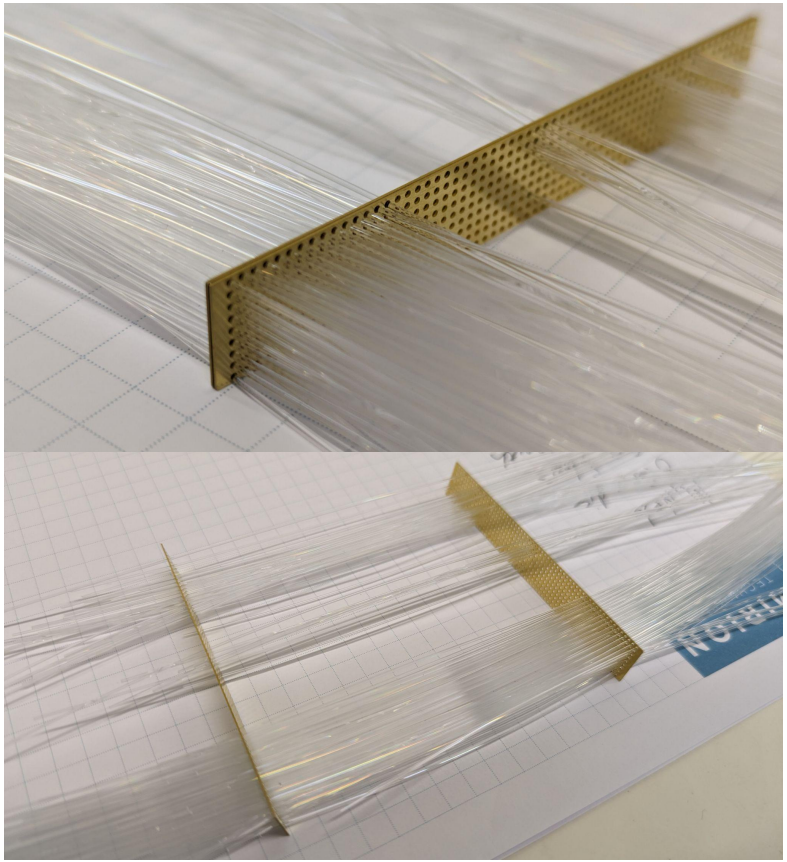


Lumi Calorimeter - Calorimeter Fibre Filling

Once fed through mesh, need to separate

- From previous test, doable but tricky
- ~2cm tolerance in length of fibres compared to mould to slot meshes
- Despite issues with holder, relatively good filling fraction so far

Next steps: Tungsten fill/Epoxy



Lumi Calorimeter - Calorimeter
