# sPHENIX Status

- TPC:
  - 4/6 **line lasers** have been implemented (i.e., can be moved around and collect data in sequence). Experts have set up and run automated GUI.
  - Confirmed that 5/6 **diffuse lasers** are good, and 2 had trigger issue which were fixed. We've been flashing diffuse lasers at low rate during cosmic data taking.
- The DAQ system has been writing to all bufferboxes, with a “mechanics” similar to last year's but faster.
- MVTX/INTT has encountered leak/cooling issues which are being fixed.
- We continue taking cosmic data for alignment and have done a lot of “summer tasks” in this waiting period.
