

TAKE FIVE for Safety- Legionella

Frank Craner

August 12, 2025

What is Legionella?

- Legionnaires' disease is caused by a type of bacteria called *Legionella*.
- The *Legionella* bacteria are found naturally in the environment, usually in water. The bacteria grow best in warm water, like the kind found in hot tubs, cooling towers, hot water tanks, large plumbing systems, and decorative fountains that are not properly maintained.
- People get Legionnaires' disease when they breathe in a mist or vapor (small droplets of water in the air) containing the bacteria.

Press Release from NYC Department of Health

The screenshot shows the NYC Department of Health website. The header includes the NYC Health logo, the tagline "Promoting and Protecting the City's Health", and a search bar. The navigation menu includes links for Home, COVID, About, Our Health, Services, Providers, Data, and Business. Below the navigation menu are three buttons: Health Topics, Neighborhood Health, and Emergency Prep. The main content area features a section titled "Legionnaires' Disease" with a sub-header "Legionnaires' Disease Cluster in Central Harlem". The text describes a community cluster of Legionnaires' disease in Central Harlem (ZIP codes 10027, 10030, 10035, 10037, and 10039). It states that the risk to most people in these ZIP codes is low, but if you live or work in the area and have flu-like symptoms, you should see a health care provider right away. Symptoms include cough, fever, chills, muscle aches, and shortness of breath. If you do not have a health care provider, you should visit [NYC Health + Hospitals](#) or call 311 or 844-NYC-4NYC (844-692-4692). As of August 11, there are:

- 90 confirmed cases
- 3 deaths
- 17 currently hospitalized

People usually develop symptoms 2 to 10 days after exposure, though it can be as long as two weeks. The Health Department has sampled and tested water from cooling towers in the investigation zone. Any cooling towers with initial positive results for Legionella bacteria have completed treatment. We are continuing to monitor and let buildings know if additional treatment is needed.

Q&A

(NYS Health Department)

Q. How do you get Legionnaires' disease?

A: People can get Legionnaires' disease if they breathe in mist or vapor containing the bacteria. The bacteria are not spread from one person to another person. A person diagnosed with Legionnaires' disease is not contagious.

Patients in health care settings with very weak immune systems may also get Legionnaire's disease when they breathe in water containing the bacteria.

Q. What are my chances for getting Legionnaire's disease if I live in a neighborhood or spend time near a building that tests positive for *Legionella*?

A: Healthy people, including children, are not likely to get *Legionella* from being near a cooling tower that tests positive. *Legionella* is so common in the environment that most people probably have been exposed in the past and not become ill.

People at higher risk of getting sick are those 50 years of age or older, current or former smokers, those with a chronic lung disease (like COPD or emphysema), those with a weak immune system from diseases like cancer, diabetes, or kidney failure, and people who take drugs that suppress (weaken) the immune system (like after a transplant operation or chemotherapy). If you are concerned about your health, you should speak with your health care provider. Symptoms of Legionnaire's Disease may include cough, shortness of breath, high fever, muscle aches, and headaches within 2-10 days after a potential exposure.

Q. Why are cooling towers tested for *Legionella*?

A: Cooling towers are tested for *Legionella* bacteria to assess the effectiveness of routine disinfection and maintenance. *Legionella* is common in the environment and many cooling towers test positive. Certain types of tests may also indicate the presence of organisms that are no longer active.

Sometimes testing is part of an investigation into existing cases of Legionnaire's disease to see if the illnesses are associated with a particular cooling tower. A positive result in a cooling tower does not necessarily mean that people will be exposed to the bacteria in the water of the cooling tower or become ill.

Q. What happens if a cooling tower tests positive?

A: As many as half of the cooling towers are likely to test positive for legionella. A positive test does not mean that people in the vicinity will get sick. In fact, sampling results are a poor indicator of the public health impact of legionella. Positive sampling results mean the owner needs to take corrective measures to decontaminate and disinfect the cooling tower in order to meet industry standards. They then need to retest to confirm that the problem has been addressed.

Q. Do building owners have to report if they have cooling towers?

A: Yes. Under a new state regulation, all owners of cooling towers are required to register their towers, test their towers for bacteria, clean and disinfect after testing, and have a regular maintenance program. Every cooling tower needs to be registered – whether it is at a school, residential building, office building or business. Registration of cooling towers in New York State enables health officials to respond rapidly to outbreaks of Legionnaire's disease and monitor inspections, annual certification, maintenance plans, sample collection and culture testing.

BNL Implementation SBMS Legionella Subject Area

The screenshot shows a web browser window displaying the SBMS (Standards-Based Management System) interface for the Legionella Subject Area. The browser's address bar shows the URL <https://sbms.bnl.gov/SubjectArea/270/index>. The page features a top navigation bar with a search bar, a user profile for Francis Craner, and a 'Favorites' link. Below this is a secondary navigation bar with links to Home, Documents, Requirements, Contact List, Roles, Reports, Other Resources, and Help. The main content area includes the Brookhaven National Laboratory logo, the SBMS title, and the U.S. Department of Energy logo. The 'Subject Area' is identified as 'Legionella' and the 'Management System' as 'Environmental Management System'. A table lists the Subject Matter Expert (Christopher Bruno), Management System Executive (Jason Remien), and Management System Steward (Sharon Kohler), each with a contact icon. To the right, it shows the Effective Date (10/24/2023, Rev 1.1), Last Reviewed date (10/24/2023), and Periodic Review Due date (10/24/2026). A left sidebar contains a table of contents with links to Introduction, Sections, Forms/Exhibits, Requirements, Training, Definitions, and Revision History. The main content area is titled 'Introduction' and contains text about the Legionella protection program, followed by a list of requirements for cooling tower owners in New York State.

Subject Area: Legionella
Management System: Environmental Management System

Subject Matter Expert: Christopher Bruno x8262
Management System Executive: Jason Remien x3477
Management System Steward: Sharon Kohler x7170

Effective Date: 10/24/2023 (Rev 1.1)

Periodic Review Due: 10/24/2026

Introduction

The Legionella protection program is designed to protect Brookhaven National Laboratory's (BNL) workers, guests, and residents against outbreaks of diseases associated with cooling towers. BNL operates and maintains approximately 32 cooling towers sitewide that are used to provide heat rejection through an evaporative process for mechanical equipment associated with comfort cooling and programmatic uses. If cooling towers are not operated and maintained properly, they can grow bacteria called *Legionella*, which cause an illness called Legionellosis. *Legionella* can be dispersed into the air in tiny droplets or mist. People can get legionellosis by breathing in the droplets or mist from a source that can be a couple of miles away.

All owners of cooling towers in New York State are required to:

- Register their cooling towers;
- Sample for *Legionella* on a regular basis;
- Report *Legionella* culture sampling results;
- Maintain, inspect, and certify cooling towers on regular basis;
- Develop, maintain and follow a maintenance program and plan; and
- Maintain their records in the online NYS cooling tower registry.

Work Planning/ Worker Safety and Health

- Chemical Safety
- Confined Space
- Hazardous Energy Control
- Ladder Safety
- Potential Work at Heights
- Legionella

Environmental Requirements associated with Chemicals

- Chemical Storage Tanks- Article 12
- Wastewater Discharges- Wastewater Discharge Limits (“SPDES”)
- Pesticide Use Requirements

Other Concerns with Chemical Use-Corrosion

ENVIRONMENTAL PROTECTION DIVISION
CHEMICAL AND OIL SPILL REPORTING FORM

SPILL NO : 19-06

Initial Notification		Date : 04/11/2019	Time : 1600
By (Name, Affiliation)		Melvin VanEssendelft, Collider Accelerator Department	
Personnel Responding At Scene		C-AD Water Group, F&O Energy and Utilities, C-AD Environmental Compliance Rep, F&O Environmental Compliance Rep.	
Spill Information		Date : 04/11/2019	Time : 1600
Material Spilled :	compressor oil		
Source of Spill :	Helium Compressor Heat Exchanger		
Quantity :	1 Other	Location : Building 1002	
Resp Dept :	Collider Accelerator Department	P.O.C. : Mel VanEssendelft	
Fire & Rescue Incident Response # :	ORPS Reportable : No		
Cause Of Spill :	Mechanical Failure		
Equipment Type :	BNL Equipment		
Asset/Equipment ID :			
Details And Remedial Action			
C-AD ESSHQ and EPD were notified of the failure of a heat exchanger used at 1002 to cool compressor oil with cooling tower water.			
The C-AD ECR and C-AD Water Group opened the tower basin and observed a sheen in a small area on the surface of the water. The sheen was about 2-3 inches long and about 1-2 inches wide. The estimated volume of oil spilled into the tower (1 oz) is based on the size of this observed sheen.			
The C-AD ECR drove to outfall 02B to observe water there. There was minimal water (estimated to be less than 1 gallon) on the ground at the outfall. The water did not show any sign of contamination.
