

CeC status, 1/6/26

- CeC accelerator is in stand-by mode till dedicated time (no lattice improvements, only maintain operational components and check beam quality from time to time).
- Slight decrease in QE (from 0.75% prior to holiday season to 0.66%). A spare cathode (last one, with less uniform QE distribution) is available.
- RF cavities tripped a couple of times during past few days and RF group experts were helping to restore the operation and their performance actively.
