

# Machine Learning for Heavy-Flavor Reconstruction

**Shyam Kumar\***, Annalisa Mastroserio, Domenico Elia INFN Bari, Italy

Supported by The FAIR Spoke 6 Project, funded by the NextGenerationEU program in Italy

hipe4ml package for ML Ref: https://doi.org/10.5281/zenodo.5070131

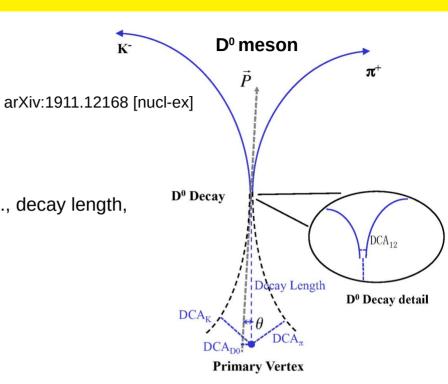

### **Charm Hadron Reconstruction**

### **Primary Vertex Reconstruction:**

→ CentralTrackVertices

Primary vertex: allows access to the DCA of daughter tracks

**Secondary vertex:** allows access to more topological variables, e.g., decay length, pointing angle ( $\cos\theta$ ), DCA<sub>DO</sub> or DCA<sub>AC</sub> etc.

### **Topological Variables**

$$\vec{dl} = \vec{SV} - \vec{PV}$$

$$\cos \theta = \frac{\vec{dl} \cdot \vec{p_{D0}}}{|\vec{dl}||\vec{p_{D0}}|}$$

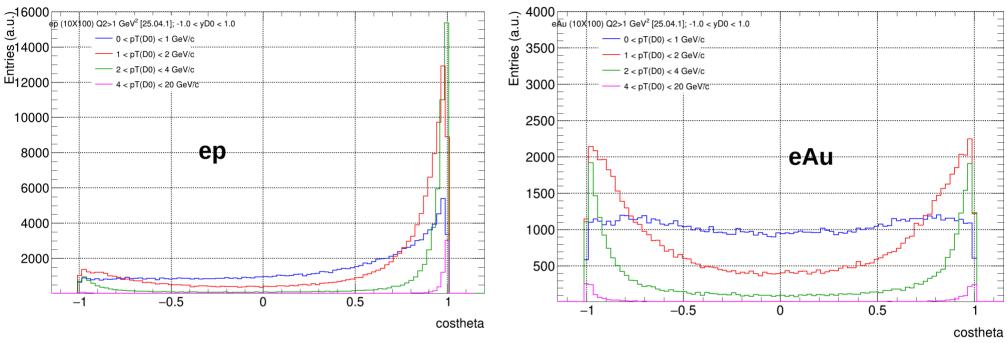

$$DCA_{D0} = |\vec{dl}| \sin \theta$$

Invariant mass: 
$$m_{D^0} = \sqrt{(E_{K^-} + E_{\pi^+})^2 - (\overrightarrow{p}_{K^-} + \overrightarrow{p}_{\pi^+})^2}$$

Cosθ: Angle between **dl** vector and  $\mathbf{p}_{D0}$ 

### **Update on Cosine Pointing Angle**

### Signal pair: From D<sup>o</sup> decay

For ep: In some cases,  $\cos\theta < 0$  because of **dl <0** Secondary vertex is reconstructed before primary vertex due to poor resolution on vertices

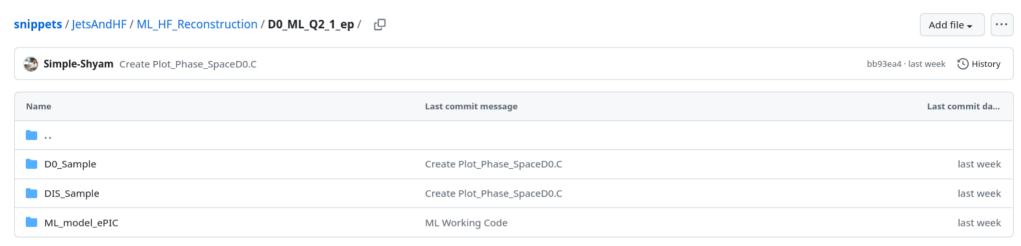

For eAu:  $\sim$ 50% cases,  $\cos\theta$  < 0 because of **dl <0** 

This is a bug because of D<sup>o</sup> decay vertex is at the primary vertex: Still fix going on

### ML Code for HF Studies

ML algorithm: BDT Binary Classifier

ML HF Reconstruction

Put the root files from analysis code in D0\_Sample and DIS\_Sample directory

Script produces all the plots which I usually show in the presentation

Working Code with existing root files

If some package missing try to install pip install package name

### Main Script

snippets / JetsAndHF / ML\_HF\_Reconstruction / D0\_ML\_Q2\_1\_ep / ML\_model\_ePIC / Run\_ML\_withData.sh

```
Simple-Shyam Update and rename Run_ML_Shyam_withData.sh to Run_ML_withData.sh
