

Status & plans for the coming weeks / months

- This campaign is over; equipment left in place, area is secured (I hope)
 - We took the scope and the HRPPD back to 510 though
- All data copied over to SDCC
- First data quality pass is finished
- Ping has just pre-processed all runs taken last week
- Craig is going to send the scope to Tektronix for a repair
- Once it is back, we will start preparations for a short (1-2 days) femtosecond laser campaign
- INFN HRPPD B-field campaign has concluded today (?)
- Silvia is pushing for presenting preliminary results in a TIC meeting on January 12th
 - Who of us is around to process the data and populate slides by then?

My TODO list for the “filtering” script

2000 A file, low HV

Channels 17 and 18 as presented in the plots

Red: our useful events (20 time bins)
Blue: any other 20 bins earlier in time

- Calibrate baseline wiggle on the fly
- Fit both Gaussians and whatever we consider a single+double photoelectron peak at once
 - The latter can be either Polya fit (if it works) or bin-by-bin
- “Subtract” the background peak up to a $\sim 2\text{-}3\sigma$ level for selections where signal merges into pedestal
- `q[] -> qs[]` and `qb[]` in the next script iteration
- Also, timing variables will be added in a proper way
