l+ jets

“resolved”: 3 jets $k_T=0.4$

“boosted”: 1 (top-tagged) jet $k_T=1.0$

→ NLO calculations: too hard $p_T(\text{top})$ spectrum
→ Similar effect seen at 8 TeV, cured with NNLO

Many new precise differential cross sections:

Leading order

$$x1 = M(t\bar{t})/2E_p \cdot \exp(y(t\bar{t}))$$

CMS

- ➔ improved gluon density at large x
- ➔ RUN II: Aim to constrain **PDFs, α_s and $m(\text{top})$** simultaneously

Charge Asymmetry A_C

- NLO: $q\bar{q}$ diagrams interfere
- Diluted @LHC due to large gg fraction

$q\bar{q}$ tree-level and box diagrams: **positive** asymmetry

ISR/FSR: **negative** asymmetry

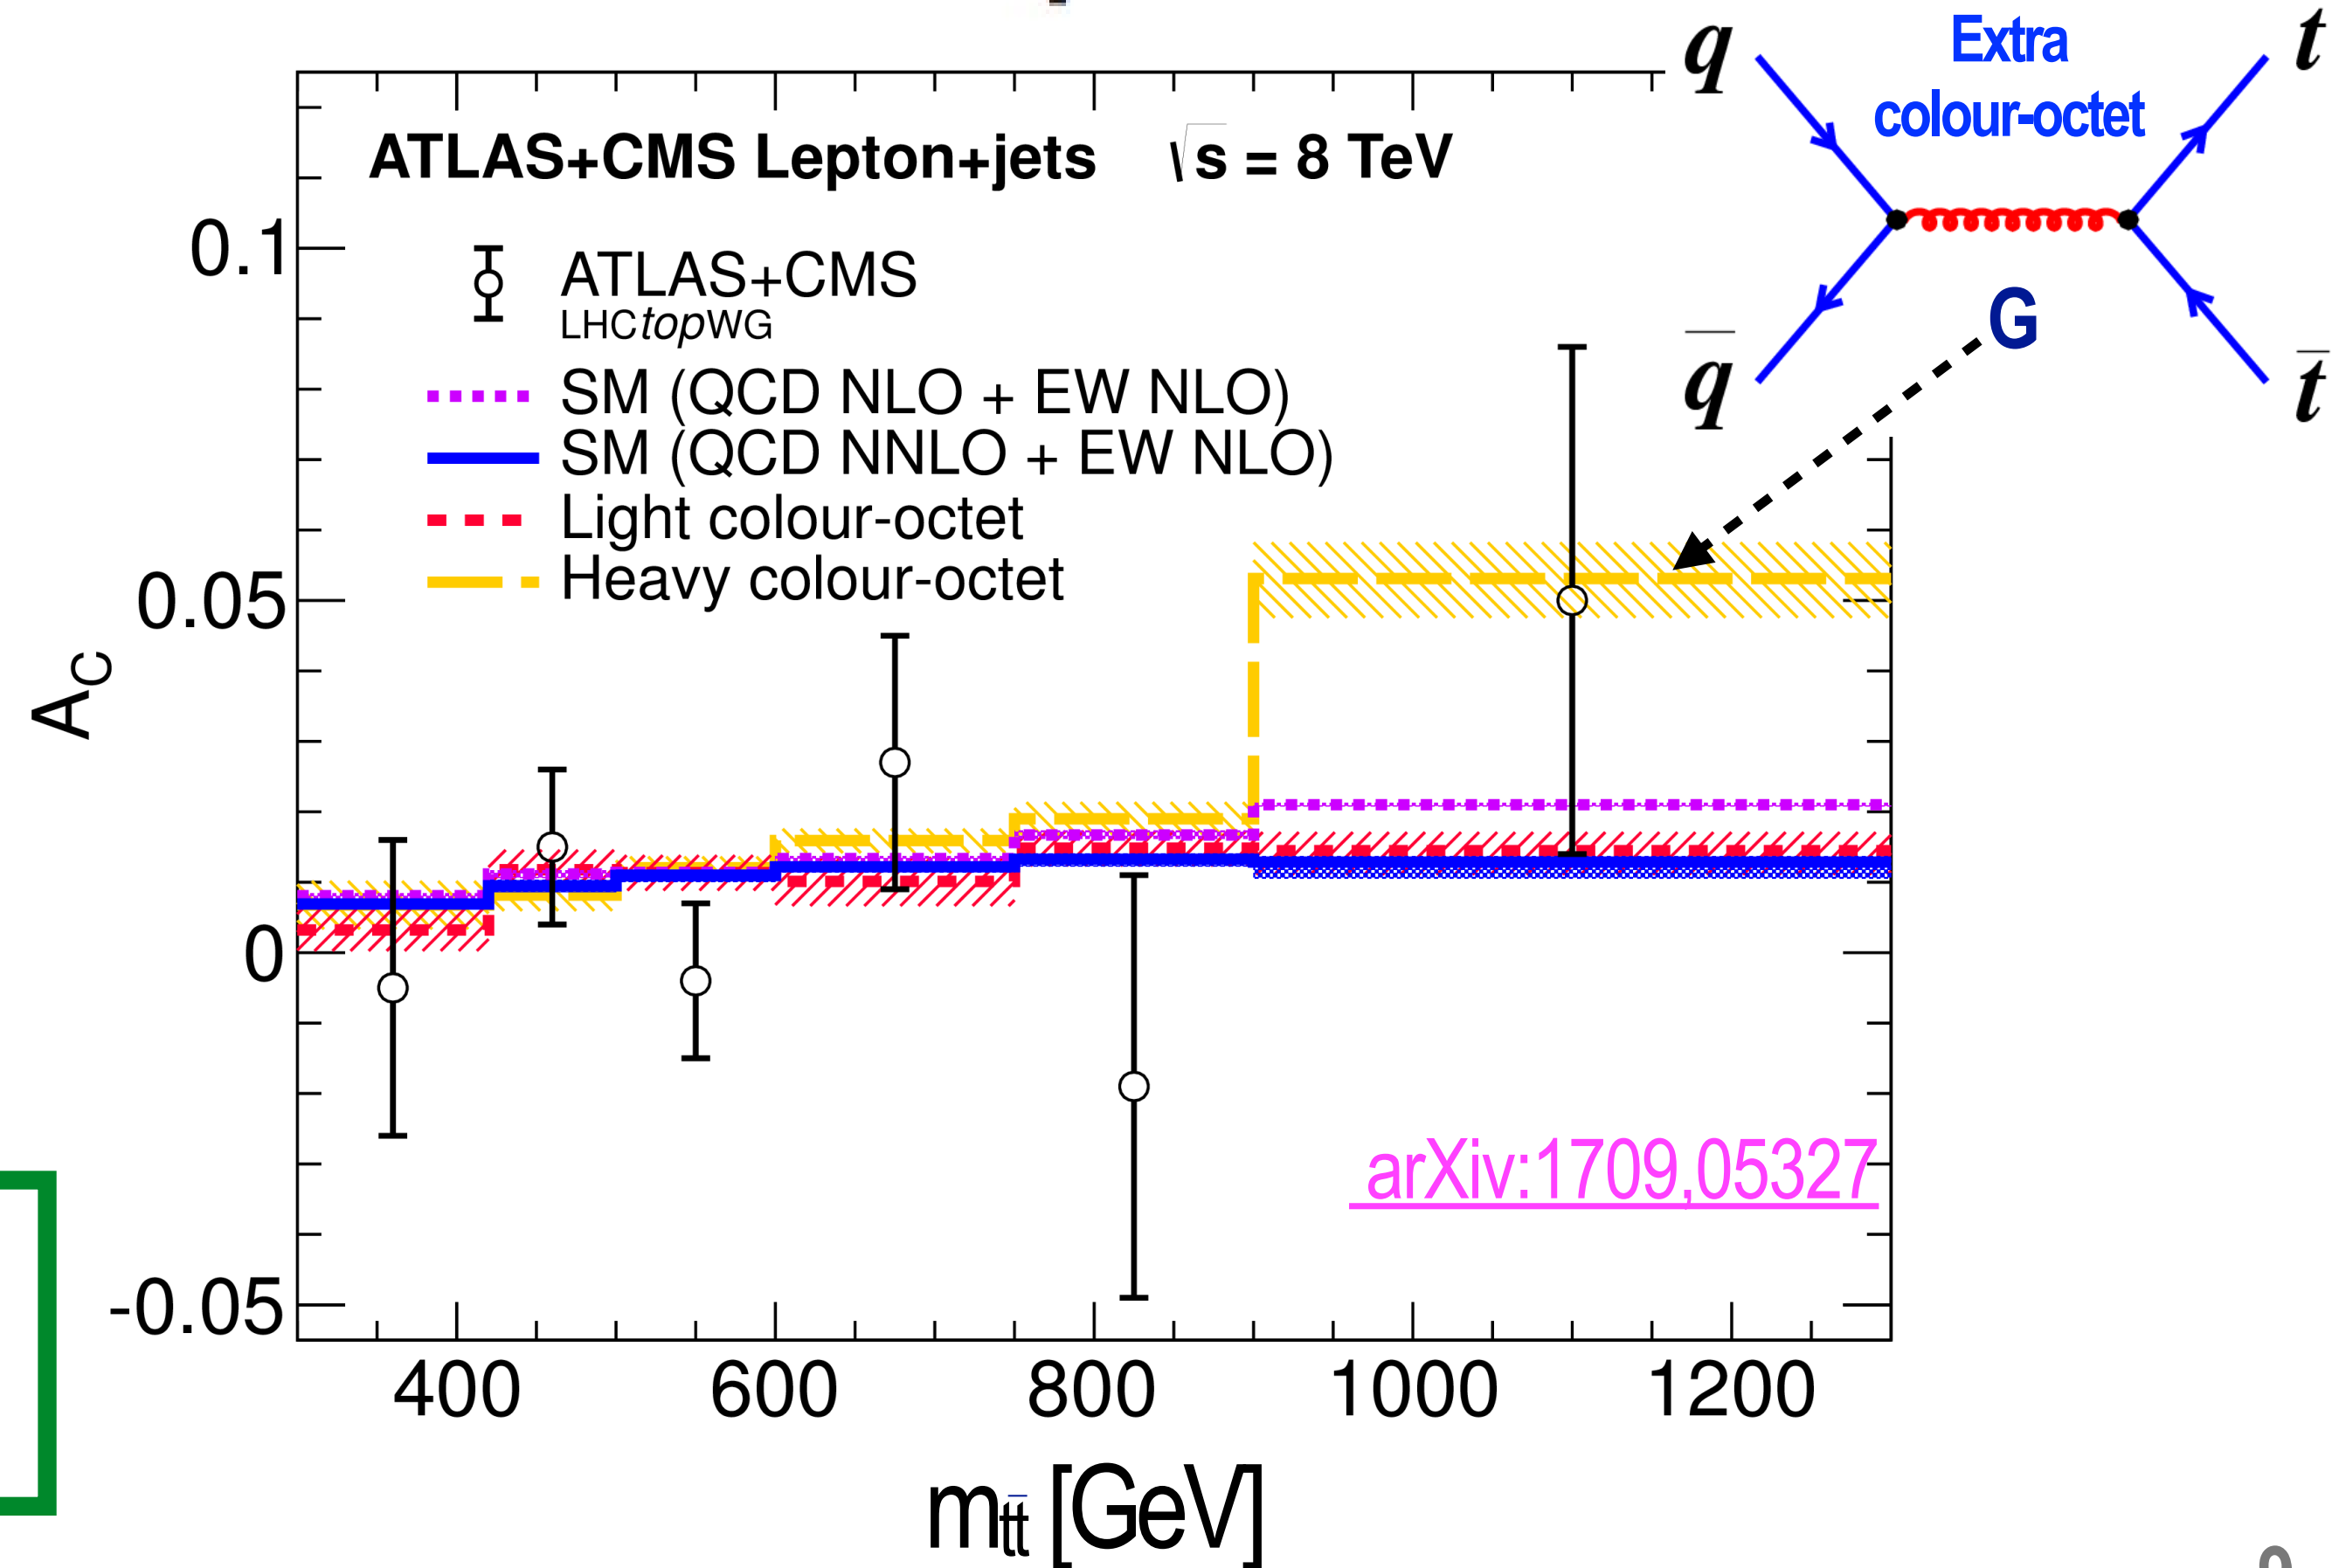

➔ Measurements consistent with SM and zero

$$\Delta|y| = |y_t| - |y_{\bar{t}}|$$

$$A_C = \frac{N(\Delta|y| > 0) - N(\Delta|y| < 0)}{N(\Delta|y| > 0) + N(\Delta|y| < 0)}$$

data and QCD properties

- Focus in the following on **two** new studies with high p_T jets

Triple differential dijets

- measure p_T spectra in bins of y_b and y^*

arXiv:1705.02628

19.7 fb⁻¹ (8 TeV)

→ 122 precise points ~8 orders of magnitude, NLO describes data 😊 ⇒ useful for PDF + α_s fit

Triple differential dijets

PDF fit

- Fit proton PDFs to HERA DIS and 122 CMS dijet points

→ Highly improved gluon density in x range [0.1-0.7]

- Fit in addition α_s

$$\alpha_s(M_Z) = 0.1199 \pm 0.015 \text{ (exp)}^{+0.0031}_{-0.0020} \text{ (theo)}$$

→ One of the most precise α_s determinations from LHC

Summary

TOP

- LHC top quark factory \approx 40M top events collected until 2016
 \Rightarrow thorough top quark examination, today glimpses shown:
 - Precision measurements: Mass, cross sections & spectra
 - $t\bar{t} + Z, W$ and $t+W, t+Z$, accessing rare processes
 - SM 😊
- Collect until end of 2018 another 60M top events \Rightarrow more precise & extended measurements + accessing rarer channels (e.g. $t\bar{t}\bar{t}\bar{t}$)

QCD

- Jet data & NNLO turn LHC into a QCD precision lab
 \Rightarrow constrain SM parameters: PDFs, α_s ,
 \Rightarrow also helpful to improve searches
