Beam Response to Extreme Operating Conditions

Rainer Cee, HIT GmbH

WAO'18, Sept. 30 – Oct. 5 2018

Co-Authors:

E. Feldmeier, M. Galonska, T. Haberer, K. Höppner, A. Peters, S. Scheloske, C. Schömers

Outline

- Introduction
 - HIT Key Facts
 - Accelerator Layout
- Morning Beam Performance Check
 - Long-Term Beam Behaviour
- Machine Stress Test
 - Cooling Water Response
 - Room Air Response
 - Beam Response
- Conclusion

HIT Key Facts

- Ion beam **therapy facility** of the university clinics in Heidelberg, Germany
- **First patient:** Nov. 2009; ~700 pts. per year; 5000th pt.: Aug '18
- **Ions:** therapy: p, C; experiments: O, He (therapy expected end of 2019)
- **Energies:** p: 48... 221 MeV / u, C: 89... 430 MeV / u; E-index: E1-E255
- **3 treatment rooms** (2 fixed beam, 1 iso-centric carbon-gantry)
+ 1 experimental room
- 3D **raster scanning** with position feedback control
 - Beam **position accuracy** at iso-centre (controlled):
 ± 0.5 mm (soft), ± 1.0 mm (sharp)
- 5 s extraction spill, **dynamic intensity control** (DIC)
- Synchrotron dipoles with **dynamic field control**

Ion Sources

Accelerator Layout

A Typical Day at HIT

6 treatment days per week, 24/7 shift operation

film by P. Heeg

Morning Beam Performance Check: Beam Diagnostics Locations

LINAC-protocol:

- currents / transmission
- stripper efficiency
- energy (7 MeV / u)

BPM: Beam Position Monitor

MWPC: Multi-Wire Proportional Chamber

Morning Beam Performance Check: Beam Position (hor. / vert.) on 1. HEBT-MWPC

+5 mm

-5 mm

+5 mm

-5 mm

Energy as Index

HEBT-MWPC Long-Term Position Variation Proton Beam, First Half Year 2018

District Cooling: Cooling Power

HEBT MWPC Long-Term Position Variation Proton Beam, First Half Year 2018

Correlation Between Hor. HEBT-Position and Cooling Power

CURVE-FITTING METHODS AND THE MESSAGES THEY SEND

"HEY, I DID A
REGRESSION."

"I WANTED A CURVED
LINE, SO I MADE ONE
WITH MATH."

"LOOK, IT'S
TAPERING OFF!"

"LOOK, IT'S GROWING
FAST!"

"I'M SOPHISTICATED, NOT
LIKE THOSE OTHERS."

"I'M MAKING A
STATEMENT."

Correlation Between Hor. HEBT-Position and Cooling Power

Pearson (linear) correlation coefficient r :

Interpretation:

$|r| = 0$: no correlation

$|r| = 1$: complete correlation

$$r = 0.97$$

Synchrotron Beam Position Monitors

Proton Beam, First Half Year 2018

Estimation:

Synchrotron bending radius: $R_0 = 4.4 \text{ m}$
Max. radial position change: $\Delta r_{\max} = 2.4 \text{ mm}$
Magnetic beam rigidity: $B\rho = \text{const.}$

$$\Rightarrow \Delta B \lesssim 5 \cdot 10^{-4} B_0$$

What is normal, what is extreme operation?

Cooling Power

Normal:

Average cooling power: 380 kW

Extreme:

Average cooling power:
high: 1696 kW
low: 221 kW

Energy Distribution

Executed therapy cycles (all ion species)
from 2018-07-30 to 2018-08-05 (week 31)

Most frequent energies:

C: 192,13 MeV/u (E61)

p: 98,27 MeV/u (E55)

Machine Stress Test Shift Programme

- 11:00 p.m.: Taking over priority from medical physicist (QA);
recording of reference beam position at synchrotron extraction
and MEBT beam positions for proton beam
- 11:10 p.m.: **Start heating phase:** running Carbon,
highest energy (430.1 MeV/u), to Gantry
- 00:00 a.m. - 03:00 a.m.: 6× (every 30 minutes) recording of proton beam positions
- 03:00 a.m.: **End of heating phase:** stopping of operation, idle
- 03:30 a.m. - 06:00 a.m.: 6× (every 30 minutes) recording of proton beam positions
- 06:00 a.m.: Daily beam performance tests
- 07:00 p.m.: Begin early shift, maintenance

LINAC Energy Phase Probe Measurement

from 2018-05-13 13:00:08 to 2018-05-14 14:04:22

from 2018-05-13 15:09:46 to 2018-05-14 14:04:57

Correlation Between Hor. Position and PS Room Underfloor

Pearson (linear) correlation coefficient:

all data: $r = 0.90$

upper branch: $r = 0.97$

lower branch: $r = 0.95$

Conclusion: Summary of Machine Stress Test

Cooling water:

- In equilibrium, the forward temperature is kept constant by ± 0.2 K
- if perturbed, temperature remains within ± 1 K

Room Temperature:

- The highest temperature rise of 2 K is found in the power supply room
- In the synchrotron room the temperature goes up by max. 0.5 K

Beam:

- No beam response in the MEBT
- The *horizontal position* in the HEBT changes by 3 mm
- The *vertical width* varies by 10%

Correlations:

- Beam parameters and room temperature are strongly correlated

Conclusion: Correlation vs. Causality

- Symptom control:
 - Learned how to do holding operation (carbon operation, $E_{\min}$, beam dump)
 - Changed beam optics in HEBT (less sensitive to beam variations)
- Possible root causes for correlations:
 - Expansion of magnets, *but* longer yoke and higher gap should compensate
 - static/dynamic field control:
 - Hall-probes, *but* they are temperature compensated within ± 3 K
 - Pick-up coil / integrator?
 - Investigations are still ongoing
 - Comments are welcome!
