

# Measurement of electroweak-boson production in p-Pb and Pb-Pb collisions at the LHC with ALICE

---

Nicolò Valle University and INFN, Pavia, Italy  
for the ALICE Collaboration

# Electroweak Bosons in Heavy-Ion Collisions

Produced in the hard processes at the initial stages of the collisions

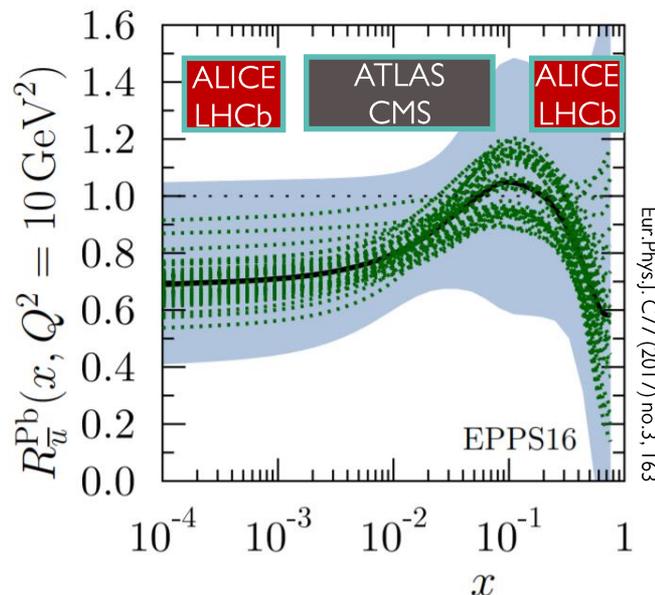

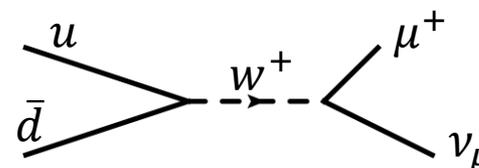

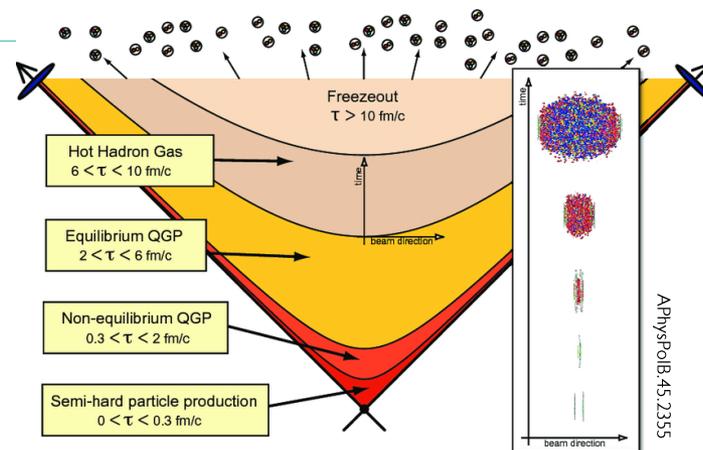

Insensitive to the presence of the strongly-interacting medium

A good way to access Parton Distribution Functions (in the proton) and their nuclear modification (nPDFs, in nuclei)

Flavour-dependent modifications of quark densities in nuclei accessible by studying  $W^+ / W^-$  asymmetry

Such initial stage effects can be studied in pA collisions

Reference for hot-matter effects on other probes

# Z and W bosons with the ALICE Detector

Looking for muons from

$$Z \rightarrow \mu^+ \mu^- \quad W^\pm \rightarrow \mu^\pm \nu_\mu$$

Muon spectrometer coverage:

$$-4 < \eta < -2.5$$

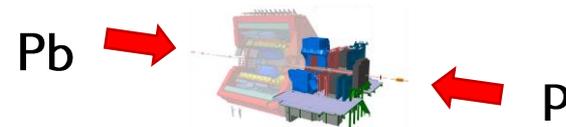

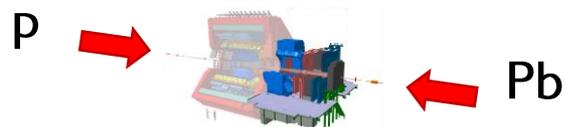

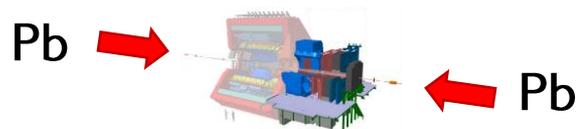

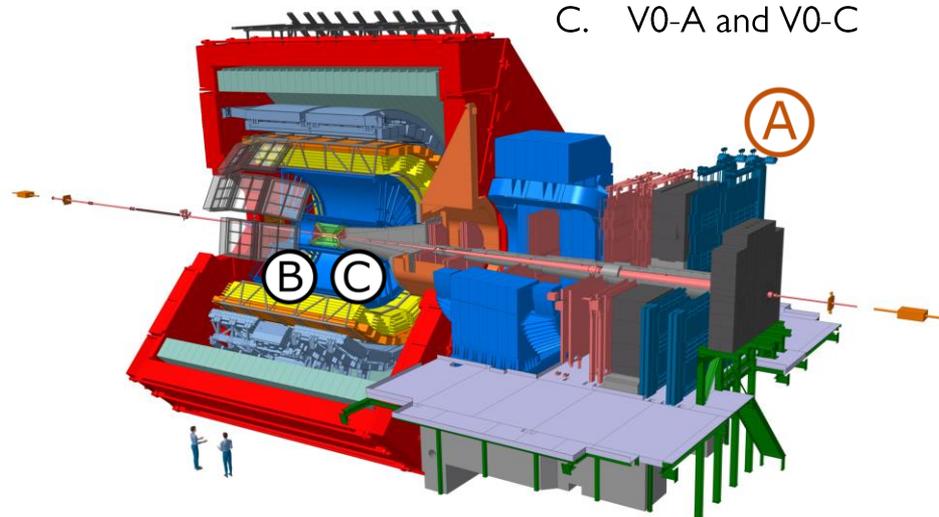

Pb-p and p-Pb asymmetry  $\rightarrow$  access to different rapidity and Bjorken- $x$  ranges:

Pb-Pb:  $2.5 < y_{\text{cms}} < 4$

“p-going”:  $2.03 < y_{\text{cms}} < 3.53$

“Pb-going”:  $-4.46 < y_{\text{cms}} < -2.96$

# Z-boson Signal Extraction

Opposite-sign muon pairs reconstructed in the spectrometer

Only high- $p_T$  muons are used

$$p_{T,\mu} > 20 \text{ GeV}/c$$

Signal extraction by counting candidates in

$$60 < m_{\mu\mu} < 120 \text{ GeV}/c^2$$

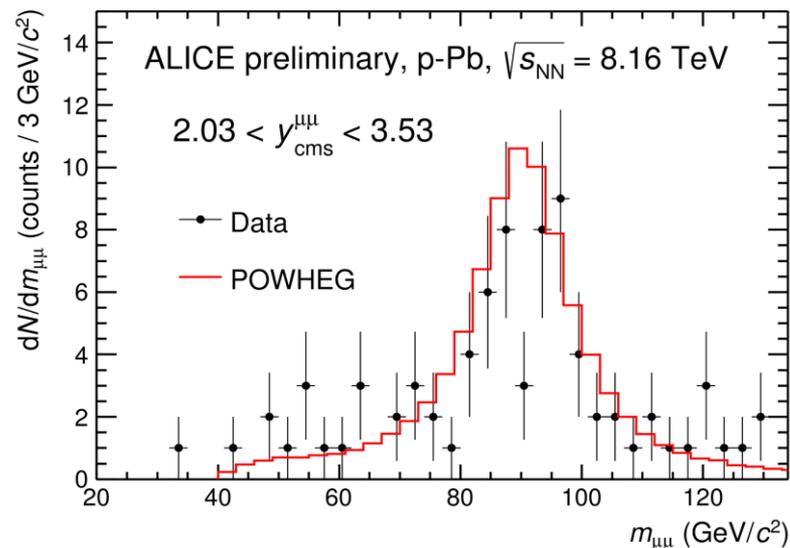

Residual background from

$$Z/\gamma^* \rightarrow \tau\tau \rightarrow \mu\mu \quad t\bar{t} \rightarrow \mu\mu$$

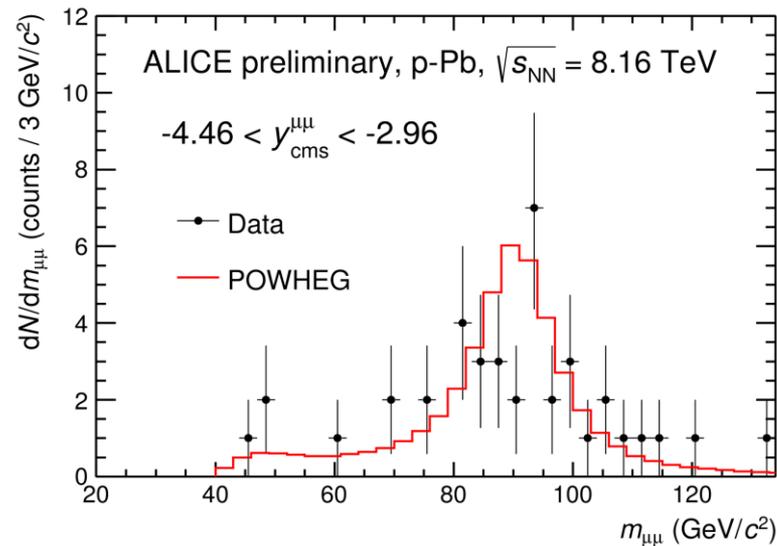

→ ~1% of the yield (POWHEG and PYTHIA)

Combinatorial background → small

Acceptance and efficiency are estimated with POWHEG simulations (embedding for centrality dependence)

ALI-PREL-316224

ALI-PREL-316228

# W-boson Signal Extraction

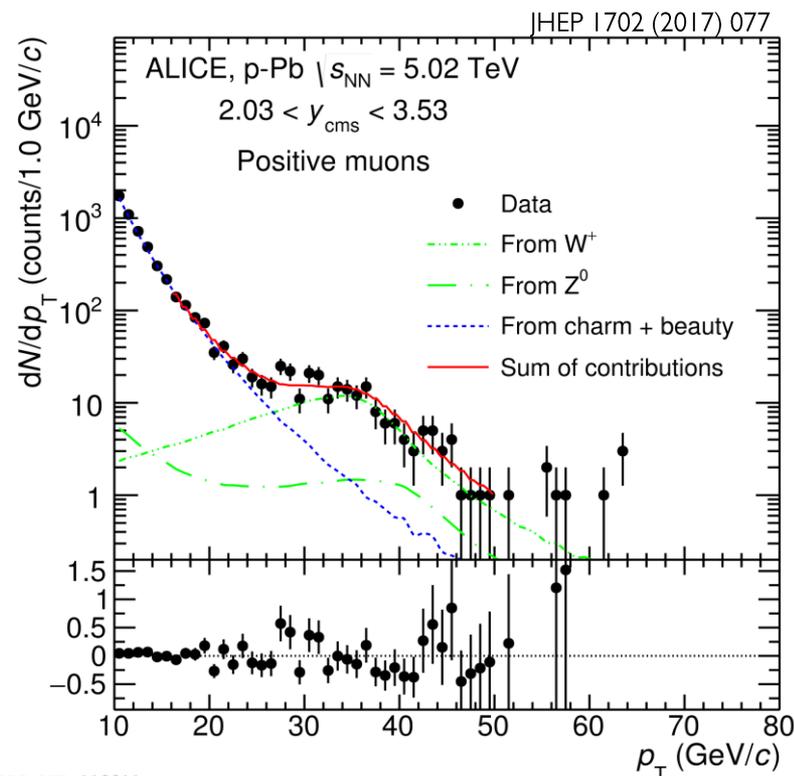

Monte-Carlo template fit of the  $p_T$  distribution of single muons

High  $p_T$  :

- Heavy-flavoured hadrons (FONLL pQCD calculations [1])
  - Z-bosons and Drell-Yan
  - ✓ Semi-leptonic decays of W
- (POWHEG)

Isospin effects taken into account by simulating pp, pn, np, nn separately

Acceptance and efficiency are estimated with POWHEG simulations

# Results

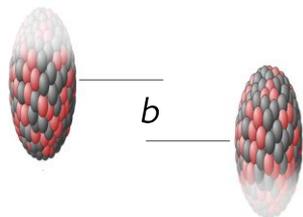

---

# Z-boson in Pb-Pb collisions, $\sqrt{s_{NN}} = 5.02$ TeV

Phys. Lett. B780 (2018) 372-383

$$R_{AA} = \frac{dN/dy}{\langle T_{AA} \rangle \sigma_{pp}}$$

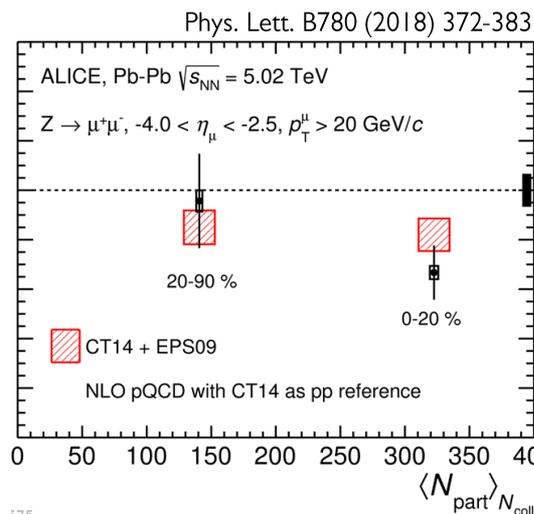

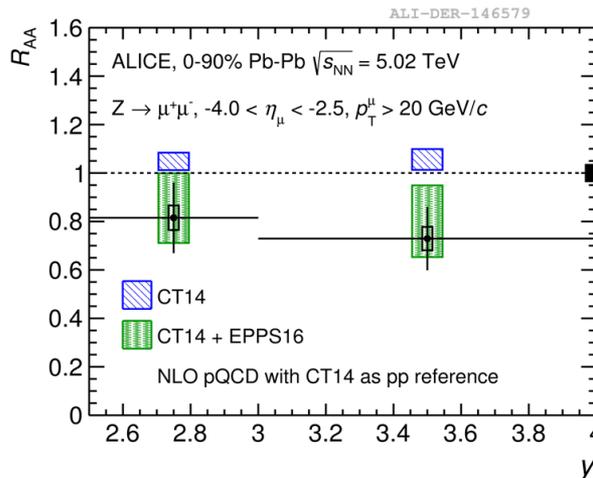

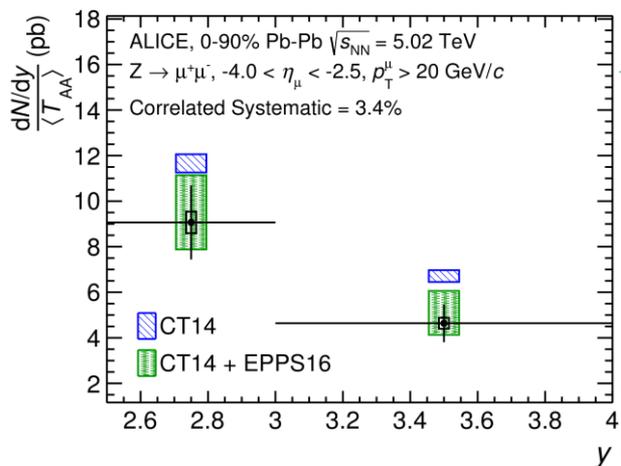

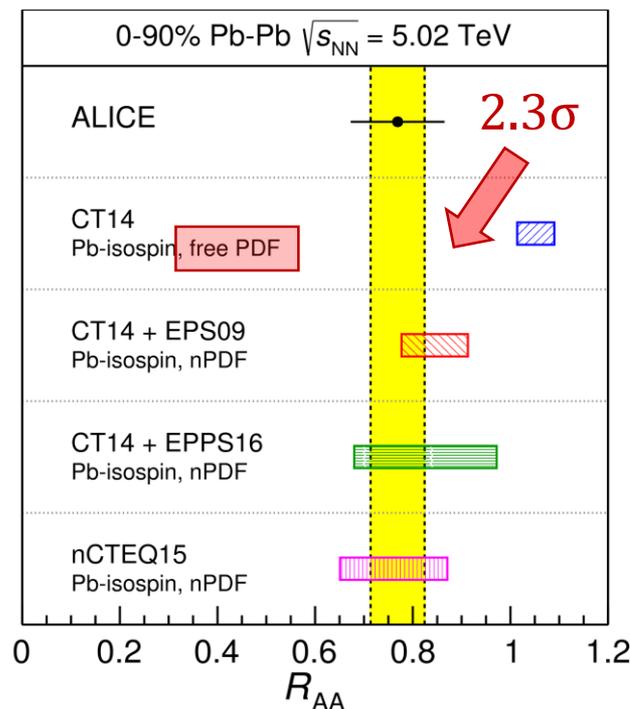

Nuclear overlap function  $T_{AA}$  by Glauber model

CT14 calculations<sup>[1]</sup> are used for  $\sigma_{pp}$

Yield and  $R_{AA}$  measured as a function of rapidity and centrality

Comparison with different theoretical calculations at NLO, with free PDFs and nPDFs [1-4]

[1] Phys.Rev. D93 (2016) no.3, 033006

[2] JHEP 0904 (2009) 065

# Z-boson in Pb-Pb collisions, $\sqrt{s_{NN}} = 5.02$ TeV

Phys. Lett. B780 (2018) 372-383

$$R_{AA} = \frac{dN/dy}{\langle T_{AA} \rangle \sigma_{pp}}$$

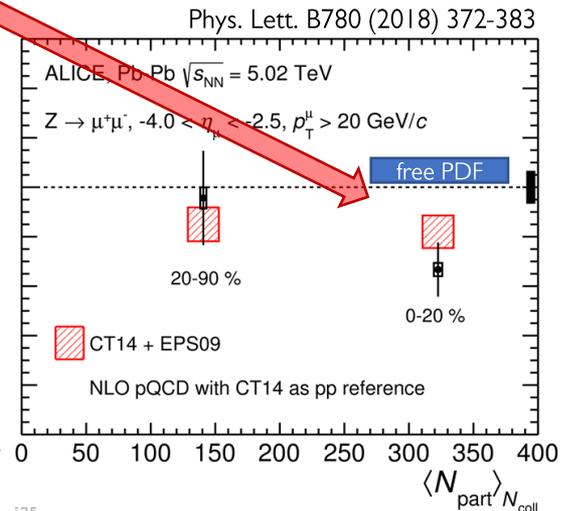

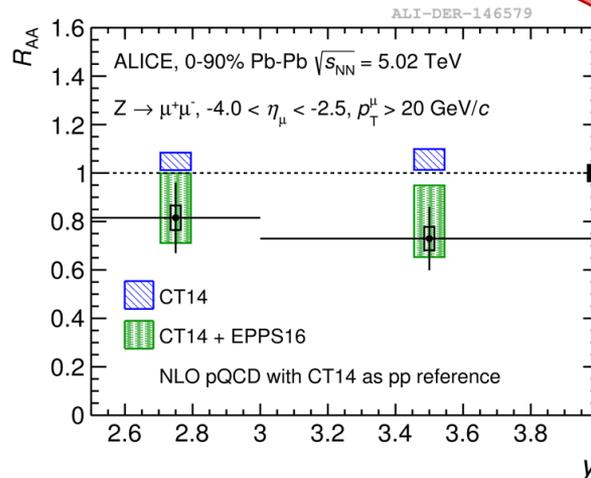

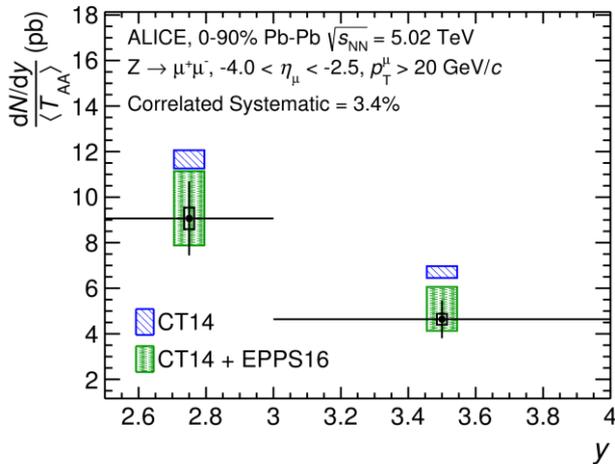

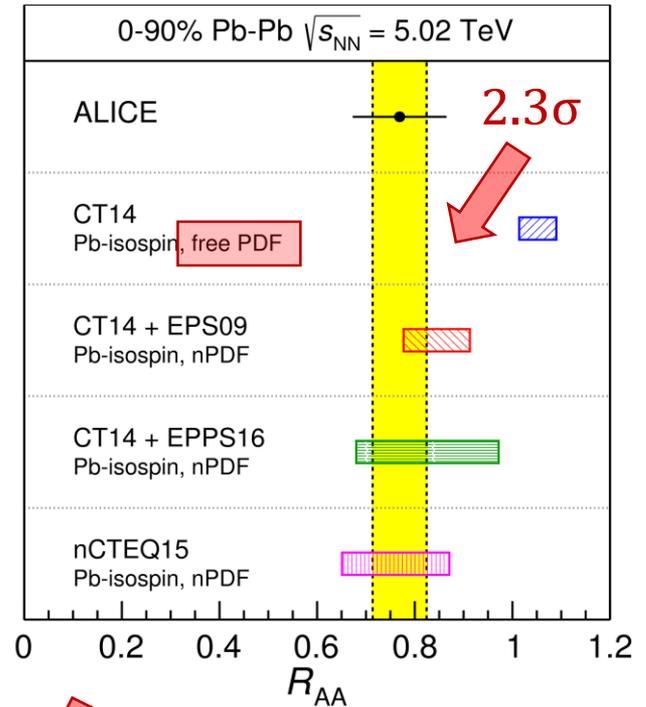

Nuclear overlap function  $T_{AA}$  by Glauber model

CT14 calculations<sup>[1]</sup> are used for  $\sigma_{pp}$

Yield and  $R_{AA}$  measured as a function of rapidity and centrality

Comparison with different theoretical calculations at NLO, with free PDFs and nPDFs [1-4]

Free PDFs calculations deviate from experiment, up to  $3\sigma$

[1] Phys.Rev. D93 (2016) no.3, 033006 [2] JHEP 0904 (2009) 065 [3] Eur.Phys.J. C77 (2017) no.3, 163 [4] Eur.Phys.J. C77 (2017) no.7, 488

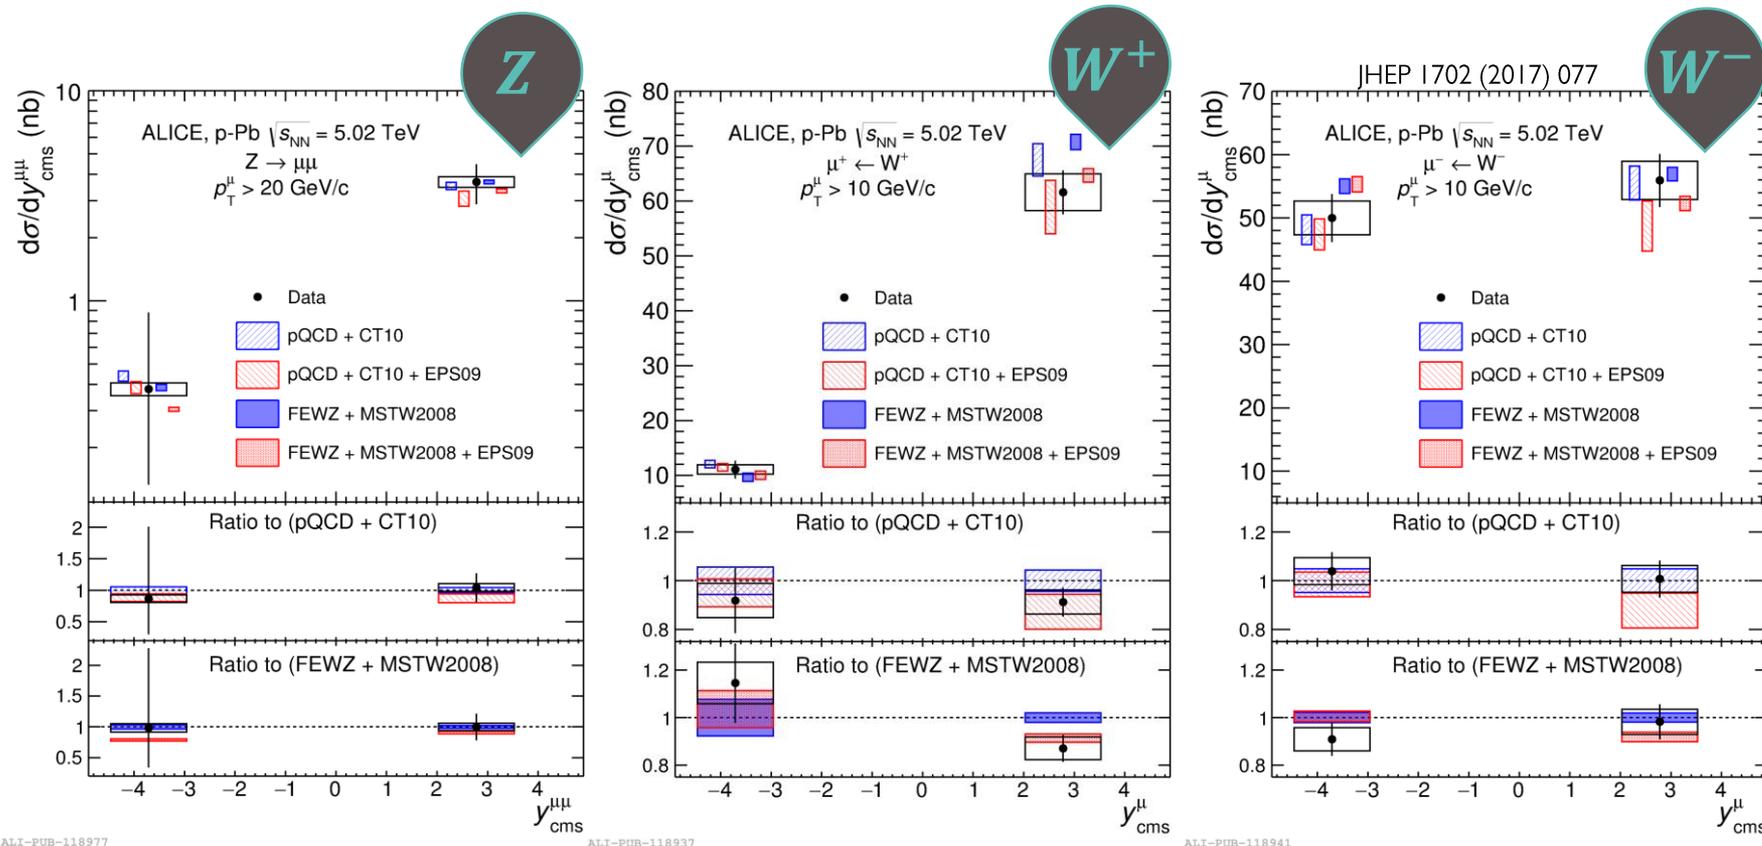

# W and Z bosons in p-Pb collisions, $\sqrt{s_{NN}} = 5.02$ TeV

JHEP 1702 (2017) 077

Results compared with NLO (based on CT10 PDFs<sup>[1]</sup>) and NNLO (with FEWZ, based on MSTW2008 PDFs<sup>[2-3]</sup>) predictions

EPS09 nPDF<sup>[4]</sup> for the nuclear modification

Here the precision of the data does not allow to draw conclusions on PDF modifications

# W and Z bosons in p-Pb collisions, $\sqrt{s_{NN}} = 5.02$ TeV

JHEP 1702 (2017) 077

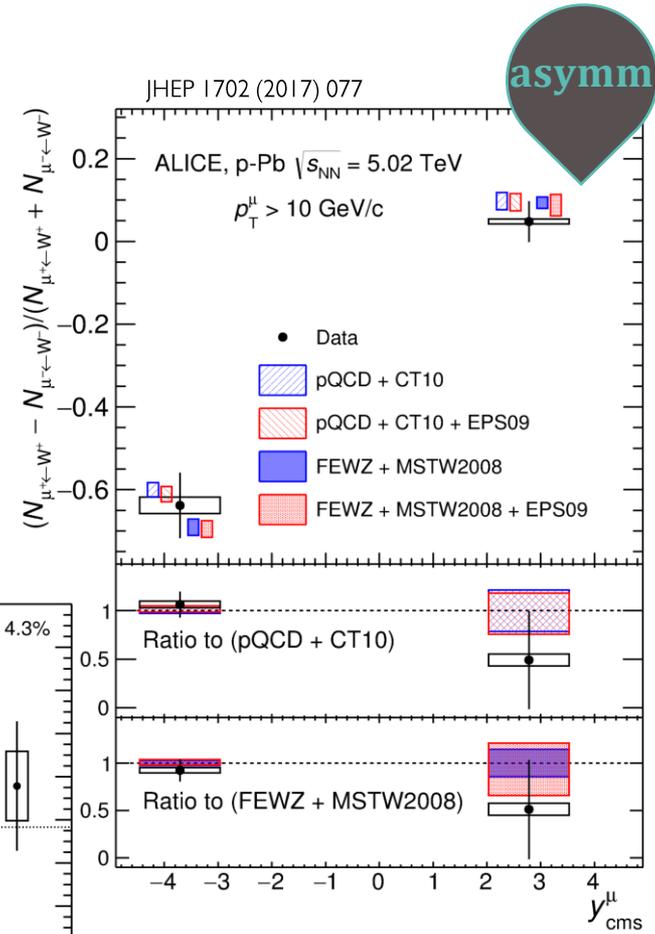

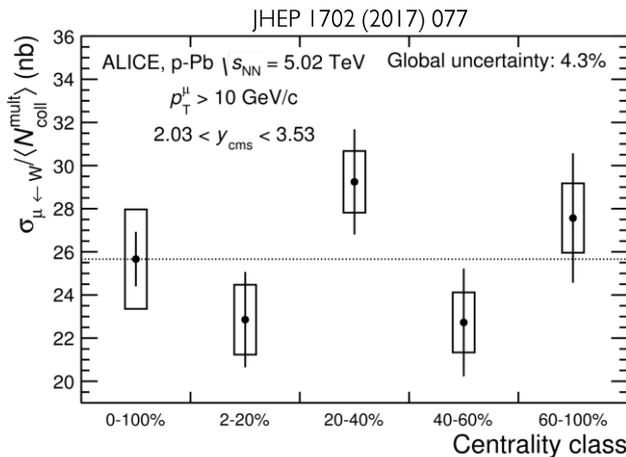

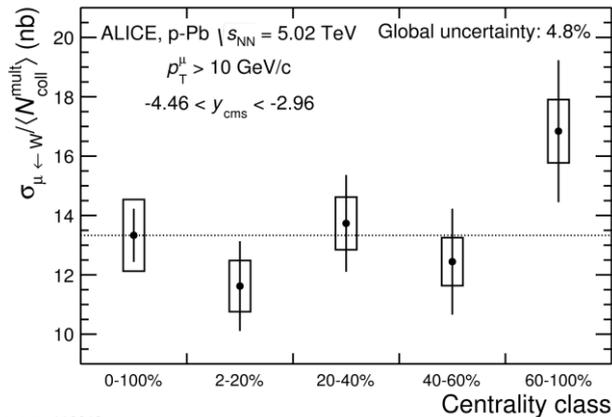

Results compared with NLO (based on CT10 PDFs<sup>[1]</sup>) and NNLO (with FEWZ, based on MSTW2008 PDFs<sup>[2-3]</sup>) predictions

EPS09 nPDF<sup>[4]</sup> for the nuclear modification

Here the precision of the data does not allow to draw conclusions on PDF modifications

Uncertainties reduced when measuring  $W^+ / W^-$  asymmetry

Within the uncertainties the production cross-section scales with the number of binary collisions

# Z-boson in p-Pb collisions, $\sqrt{s_{NN}} = 8.16$ TeV

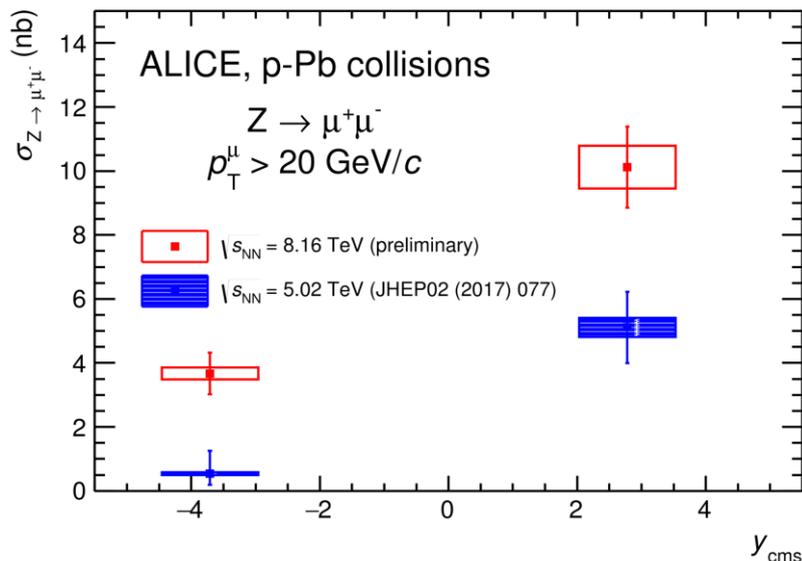

First measurement of Z in p-Pb collisions at 8.16 TeV

Increased luminosity (almost 2 times greater) with respect to p-Pb at 5.02 TeV

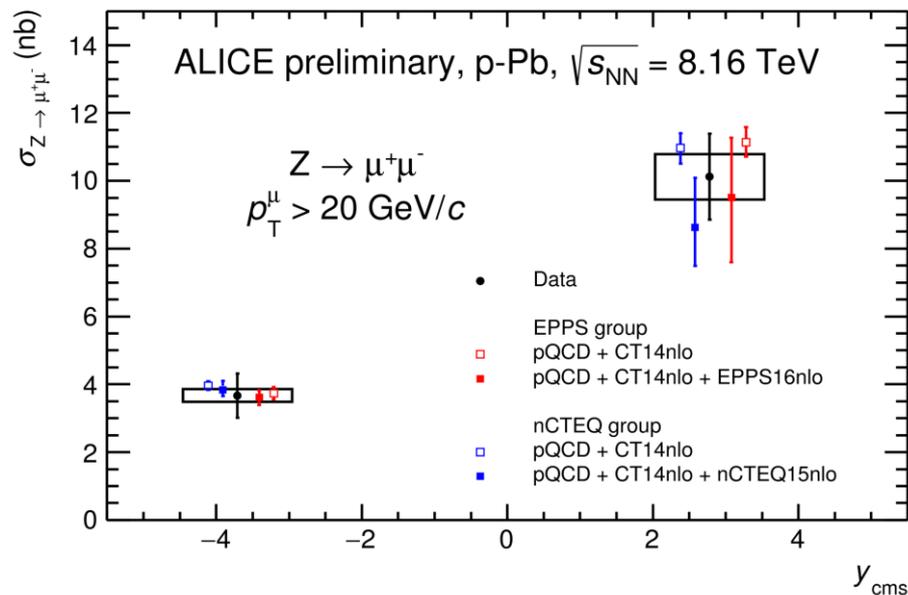

Cross section measured at forward and backward rapidity

Comparison with different theoretical calculations at NLO, with free PDFs (CT14<sup>[1]</sup>) and nPDFs (from EPPS and nCTEQ groups<sup>[2-3]</sup>)

With this precision (on both experimental data and models) no firm conclusions on PDF modifications

# Summary

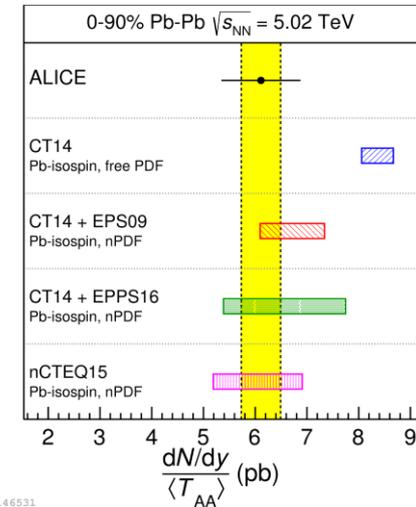

The measurements at large rapidities provide data in a kinematic region where the nPDFs are less constrained

The results from Pb-Pb data are better described by calculations including nuclear modification of PDFs

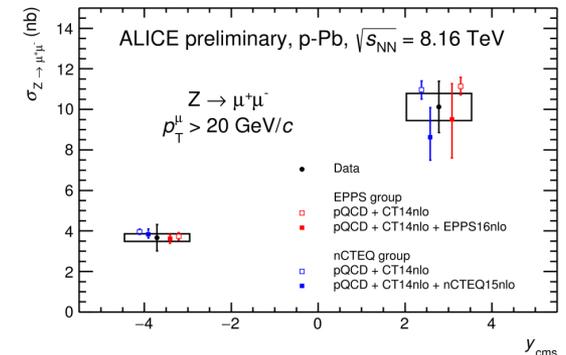

p-Pb results are still statistically limited but these new measurements can be included in nPDFs global fits

Analyses ongoing on Z and W bosons production in Pb-Pb at 5.02 TeV, and on W-boson production at 8.16 TeV
