

Measurement of inclusive production of light charged hadrons at BaBar

Friday, 16 August 2013 11:40 (20 minutes)

Inclusive hadron production cross sections in e^+e^- collisions shed light on fundamental questions of hadronization and fragmentation processes. We present measurements of inclusive spectra of various light hadrons produced in e^+e^- collisions at a center-of-mass energy of about 10.5 GeV. These results help test the scaling properties of the cross sections by comparison with previous measurements at higher center-of-mass energies and with theoretical predictions.
