The CMS Detector

The Compact Muon Solenoid (CMS) Detector

- ▶ Inner silicon tracker
 - ▶ determines tracks and vertices of charged particles
 - ▶ electron, muon, jet
- ▶ *PbWO₄* ECAL
 - ▶ measures energy and location of electrons
- ▶ Brass-scintillator HCAL
 - ▶ measures energy of jets
- ▶ Muon chambers
 - ▶ measures location and momentum of muons
- ▶ Combine information from subdetectors to measure missing transverse energy

Invisible Higgs and ZZ Production

Signal: Invisible Decay Modes

- ▶ Z boson Higgs-strahlung
- ▶ Higgs decay products invisible to detector
 - ▶ Not a Standard Model phenomenon
 - ▶ Model-independent search
- ▶ Some theorized decay modes:
 - ▶ Decay into pair of Stable neutral Lightest SUSY Particles (LSP)
 - ▶ neutralinos (1)
 - ▶ Large extra dimensions
 - ▶ Higgs oscillates into a graviscalar and disappears from our brane (2)
 - ▶ Decay into pair of graviscalars (3)
 - ▶ Decay into light neutrino and heavy neutrino (4)
- ▶ Explore range of Higgs masses
 - ▶ 105-145 GeV

Invisible Higgs and ZZ Production

Main Background: ZZ Production

- ▶ Same final state as $ZH \rightarrow \ell^+\ell^- + H(\text{inv})$
 - ▶ Two leptons from Z decay
 - ▶ Large \cancel{E}_T
- ▶ Irreducible Background
 - ▶ Comprises $\sim 70\%$ of total background at final selection
- ▶ Some kinematic differences between ZZ and ZH
 - ▶ Mass difference between Z and Higgs

MC Samples For Signal And Background, and Datasets

Generators

- ▶ All ZH samples, $t\bar{t}$, tW generated with POWHEG (v2.0)
- ▶ $Z + jets$, and diboson with MADGRAPH (v5.1.3)
- ▶ Detector response modeled with GEANT4
- ▶ PDFs modeled through:
 - ▶ CTEQ6L parameterization at LO
 - ▶ CT10 parameterization at NLO

Calculations

- ▶ NLO $\sigma(ZZ)$, $\sigma(WZ)$ computed using MCFM
- ▶ $\sigma(ZH)$ computed at NNLO in QCD, and NLO in EW (5)

Datasets

- ▶ full 2011 and 2012 data samples at 7 TeV and 8 TeV
- ▶ Integrated luminosity at $\sqrt{s} = 7$ TeV: 5.1 fb^{-1}
- ▶ Integrated luminosity at $\sqrt{s} = 8$ TeV: 19.6 fb^{-1}

Conclusion

Utilizing Missing Energy

Hadronic Recoil

- ▶ $ZH \rightarrow \ell^+ \ell^- + H(\text{inv})$ and $ZZ \rightarrow \ell^+ \ell^- \nu \bar{\nu}$ characterized by large \cancel{E}_T from neutrinos and/or non-standard particles
- ▶ Dominant background: $Z + \text{jets}$ with mis-measured large \cancel{E}_T
 - ▶ $\sigma(Z + \text{jets}) > 10^5 \cdot \sigma(ZZ \rightarrow \ell^+ \ell^- \nu \bar{\nu})$
- ▶ The goal is to reduce \cancel{E}_T of imbalanced events to effectively subtract the hadronic recoil and suppresses $Z + \text{jets}$ (6)
- ▶ *red-* \cancel{E}_T variable:
 - ▶ $\text{red-}\cancel{E}_T^i = p_T^{\ell\ell i} + \min(R_{cl}^i, R_{uncl}^i)$
 - ▶ $i = \perp, \parallel$ to dilepton p_T
 - ▶ $\overrightarrow{R_{cl}} = \sum_{jet}^{N_{jets}} \overrightarrow{p_T^{jet}}$
 - ▶ $\overrightarrow{R_{uncl}} = -\overrightarrow{\cancel{E}_T} - \overrightarrow{p_T^{\ell\ell}}$
 - ▶ $\text{red-}\cancel{E}_T = \overrightarrow{|\text{red-}\cancel{E}_T|}$

Event Selection

Discriminating Variables

Main selection cuts

- ▶ Two leptons:
 - ▶ well-identified, isolated, same flavor leptons
 - ▶ $p_T^\ell > 20 \text{ GeV}$
- ▶ Reject events with jets if:
 - ▶ $E_T > 30 \text{ GeV}$
 - ▶ bjet:
 - ▶ soft-muon ($p_T > 3 \text{ GeV}$)
 - ▶ b-tag and ($p_T > 20 \text{ GeV}$ and $|\eta| < 2.5$)
- ▶ Reject events with additional leptons if $p_T > 10 \text{ GeV}$
- ▶ $|m_{\ell\ell} - m_Z| < 15 \text{ GeV}$

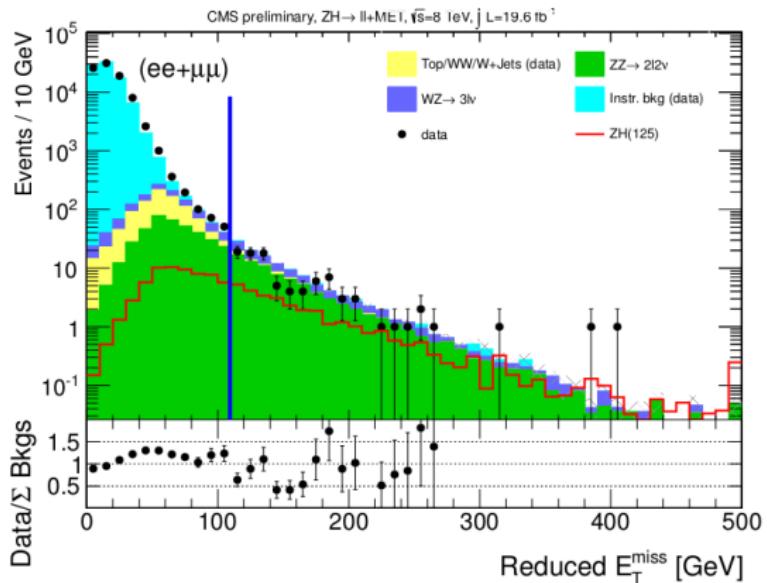

+ Optimized cuts

- ▶ $\Delta\phi_{\ell\ell - E_T} > 2.6$
- ▶ $0.8 < \frac{E_T}{p_T^\ell} < 1.2$
- ▶ red- $E_T > 110 \text{ GeV}$

Event Selection

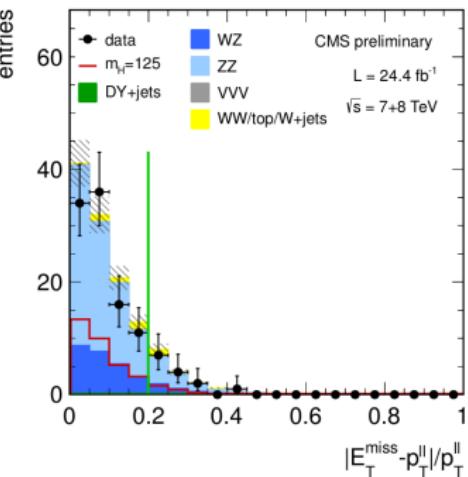

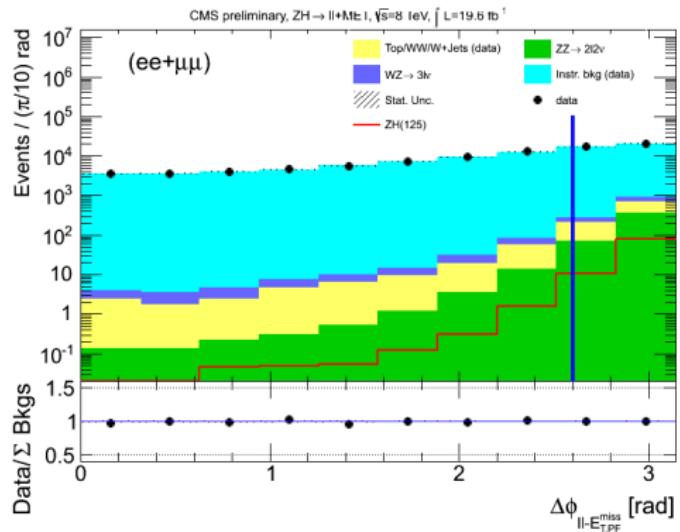

Reduced Missing Energy

- ▶ Preference of *red- E_T* over E_T
 - ▶ Performs better in signal efficiency and Drell-Yan background suppression
 - ▶ Found to be more stable under pile-up condition and jet energy scale variations

Event Selection

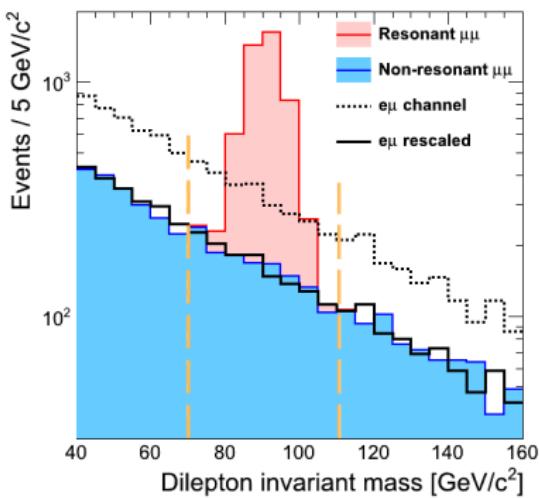

Other Optimization Variables

- Both used in ZH optimization along with *red- E_T*
 - Optimized to obtain best expected exclusion limits at 95% C.L.
- Suppress Drell-Yan and Top processes

Background Estimation with Data

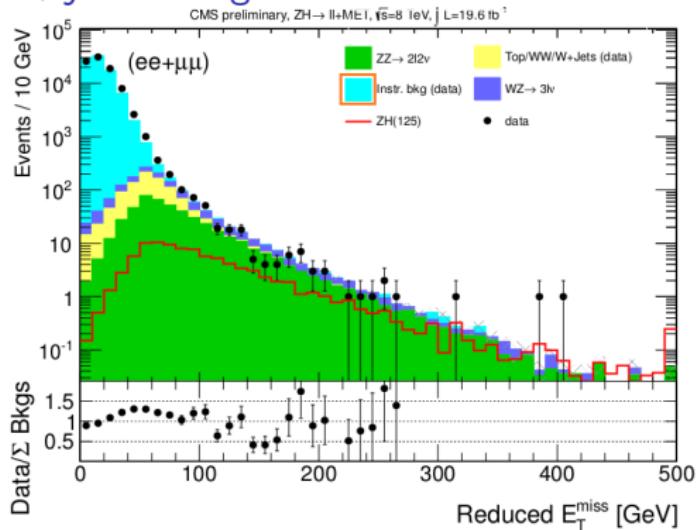

Non-Resonant Background Estimation

- ▶ Non-resonant backgrounds are mainly leptonic W decays
 - ▶ $WW, tW, t\bar{t}$, single top, $Z \rightarrow \tau\tau$
- ▶ Calculate scale factors from data control region of $e^\pm\mu^\mp$ and $\ell^+\ell^-$ (e^+e^- or $\mu^+\mu^-$) events that pass selection cuts
 - ▶ Z-peak sidebands $40 < m_{\ell\ell} < 70 \text{ GeV}$ and $110 < m_{\ell\ell} < 200 \text{ GeV}$
- ▶ Apply scale factors $\alpha_{\ell\ell} = \frac{N_{\ell\ell}^{SB}}{N_{e\mu}^{SB}}$
 - ▶ $N_{\ell\ell}^{peak} = \alpha_{\ell\ell} \cdot N_{e\mu}^{peak}$
- ▶ Checked with closure test

Background Estimation with Data

$Z + jets$ Background Estimation

- ▶ Modeled from orthogonal $\gamma + jets$ control sample
 - ▶ larger statistics and topologically equivalent
 - ▶ MC may not fully model detector and pile-up effects in tail of red- E_T

- ▶ Normalize to $Z + jets$
- ▶ Reweighting factors as function of p_T^Z and number of reconstructed vertices
- ▶ Subtract EW processes w/ photons and neutrinos (MC)
- ▶ Modeling is improved for red- E_T distribution for $Z + jet$

Systematics

Systematic Uncertainties of ZH Analysis

Type	Source	Uncertainty(%)
Rate	PDF	4-5
	QCD scale variation (ZH)	7
	QCD scale variation (VV)	7-10
	Luminosity	2.2-4.4
	Lepton Trigger, Reco., Iso.	3
	$Z/\gamma^* \rightarrow ll$ normalization	100
Shape and Rate	Top, WW, W+jets normalization	25-100
	MC statistics ZH,ZZ,WZ	1-5
	Control sample statistics $Z/\gamma^* \rightarrow ll$	12-24
	Control sample statistics NRB	53-100
	Pile-up	0.1-0.3
	b-tagging Efficiency	0.2
	Lepton Momentum Scale	1
	Jet Energy Scale, Resolution	1-3
	Unclustered energy	1-4

- ▶ Combined relative signal efficiency uncertainty 12%
 - ▶ Theoretical uncertainty
 - ▶ PDF uncertainties
- ▶ Total relative uncertainty on background estimation 15%
 - ▶ Theoretical uncertainty (ZZ,WZ)

7 TeV Background Yields

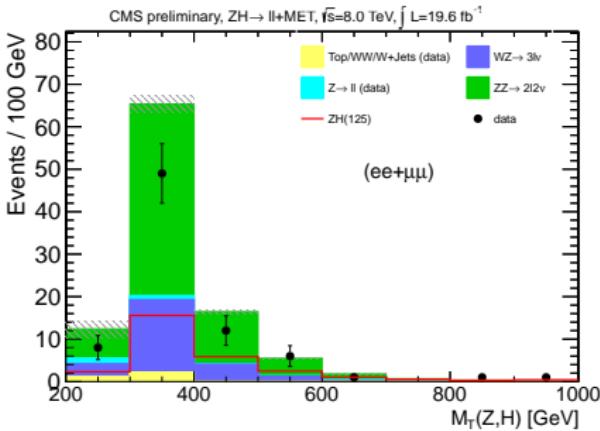

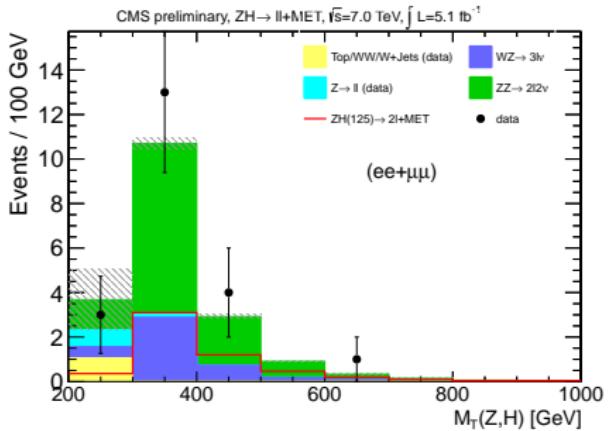

8 TeV Background Yields

Limit Results

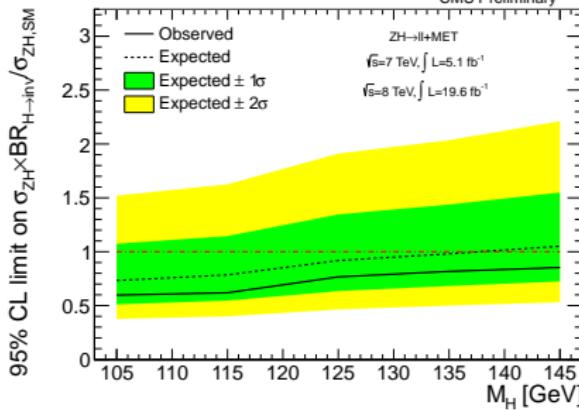

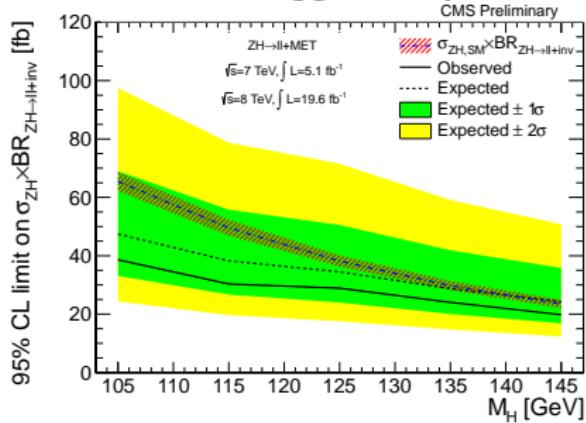

Shape Analysis for Invisible Higgs

- ▶ $m_T^2 = \left(\sqrt{p_T^{\ell\ell^2} + m_{\ell\ell}^2} + \sqrt{\cancel{E}_T^2 + m_{\ell\ell}^2} \right)^2 - \left(\vec{p_T^{\ell\ell}} + \vec{\cancel{E}_T} \right)^2$
- ▶ Exploit differences in kinematics
 - ▶ $ZZ \rightarrow \ell^+\ell^-\nu\bar{\nu}$ and $ZH \rightarrow \ell^+\ell^- + H(inv)$ both have missing energy, but mass of missing particle is different
- ▶ Shape used for all Higgs masses
 - ▶ 105, 115, 125, 135, 145 GeV

Limit Results

Limits on Invisible Higgs Decay

- ▶ Upper limit on $BR(H \rightarrow \text{invisible})$
 - ▶ Assume SM production rate
- ▶ Use modified frequentist construction CL_s
- ▶ Use Shape of Transverse Mass of Z and H

- ▶ For Higgs with $m_H = 125 \text{ GeV}$
 - ▶ Observed 95% C.L. upper limit 75%
 - ▶ Expected 95% C.L. upper limit 91%

m_H (GeV)	105	115	125	135	145
Obs Lim(%)	60	63	75	82	85

Conclusion

Conclusions and looking forward.

- ▶ Set limits on invisible higgs branching fraction for SM-range masses
 - ▶ $m_H = 105$ GeV: Observed limit: = 60%, Expected limit: = 73%
 - ▶ $m_H = 115$ GeV: Observed limit: = 63%, Expected limit: = 79%
 - ▶ $m_H = 125$ GeV: Observed limit: = 75%, Expected limit: = 91%
 - ▶ $m_H = 135$ GeV: Observed limit: = 82%, Expected limit: = 97%
 - ▶ $m_H = 145$ GeV: Observed limit: = 85%, Expected limit: = 105%
- ▶ Comparable results to CMS and ATLAS indirect and direct searches (7)
(8) (9)
- ▶ Continue analysis to explore Higgs masses beyond 150 GeV
- ▶ CMS-PAS-HIG-13-018 (10)
