## Higgs property measurements in ATLAS

Friday, 16 August 2013 16:30 (25 minutes)

I present measurements of the properties of the newly discovered boson using the full Run I pp collision dataset recorded by the ATLAS experiment. The properties include the mass, signal strengths and couplings of the boson as well as its spin/CP states.

I will discuss the details about the statistical combination of these property measurements from various decay channels and present the latest combined results.
