XXVIII International Workshop on Deep Inelastic Scattering and Related Subjects

Contribution ID: 188

Type: Contributed Talk

Wednesday, 25 March 2020 09:00 (22 minutes)

PHENIX has made a comprehensive measurement of low $p_{\rm T}$ direct photon yield in Au+Au collisions at 200 GeV that show both a large yield and a large azimuthal anisotropy produced. The mechanism for such simultaneous large production is not well understood yet.

Recently the PHENIX collaboration has improved on those measurements by using the Au+Au data collected in 2014 which provides a 10-fold increase in statistics. Furthermore, PHENIX has found that the low $p_{\rm T}\,$ direct photon yield $dN_{\gamma}/d\eta$ is proportional to $(dN_{\rm ch}/d\eta)^{\alpha}$. This scaling holds for beam energies both at RHIC and at the LHC in large-on-large systems. An extrapolation to smaller systems suggests an onset of QGP formation at low $dN_{\rm ch}/d\eta$.

In this talk I will show the most recent results on direct photon measurements from large and small systems.
