

Tracking software status going into January workfest

Tony Frawley

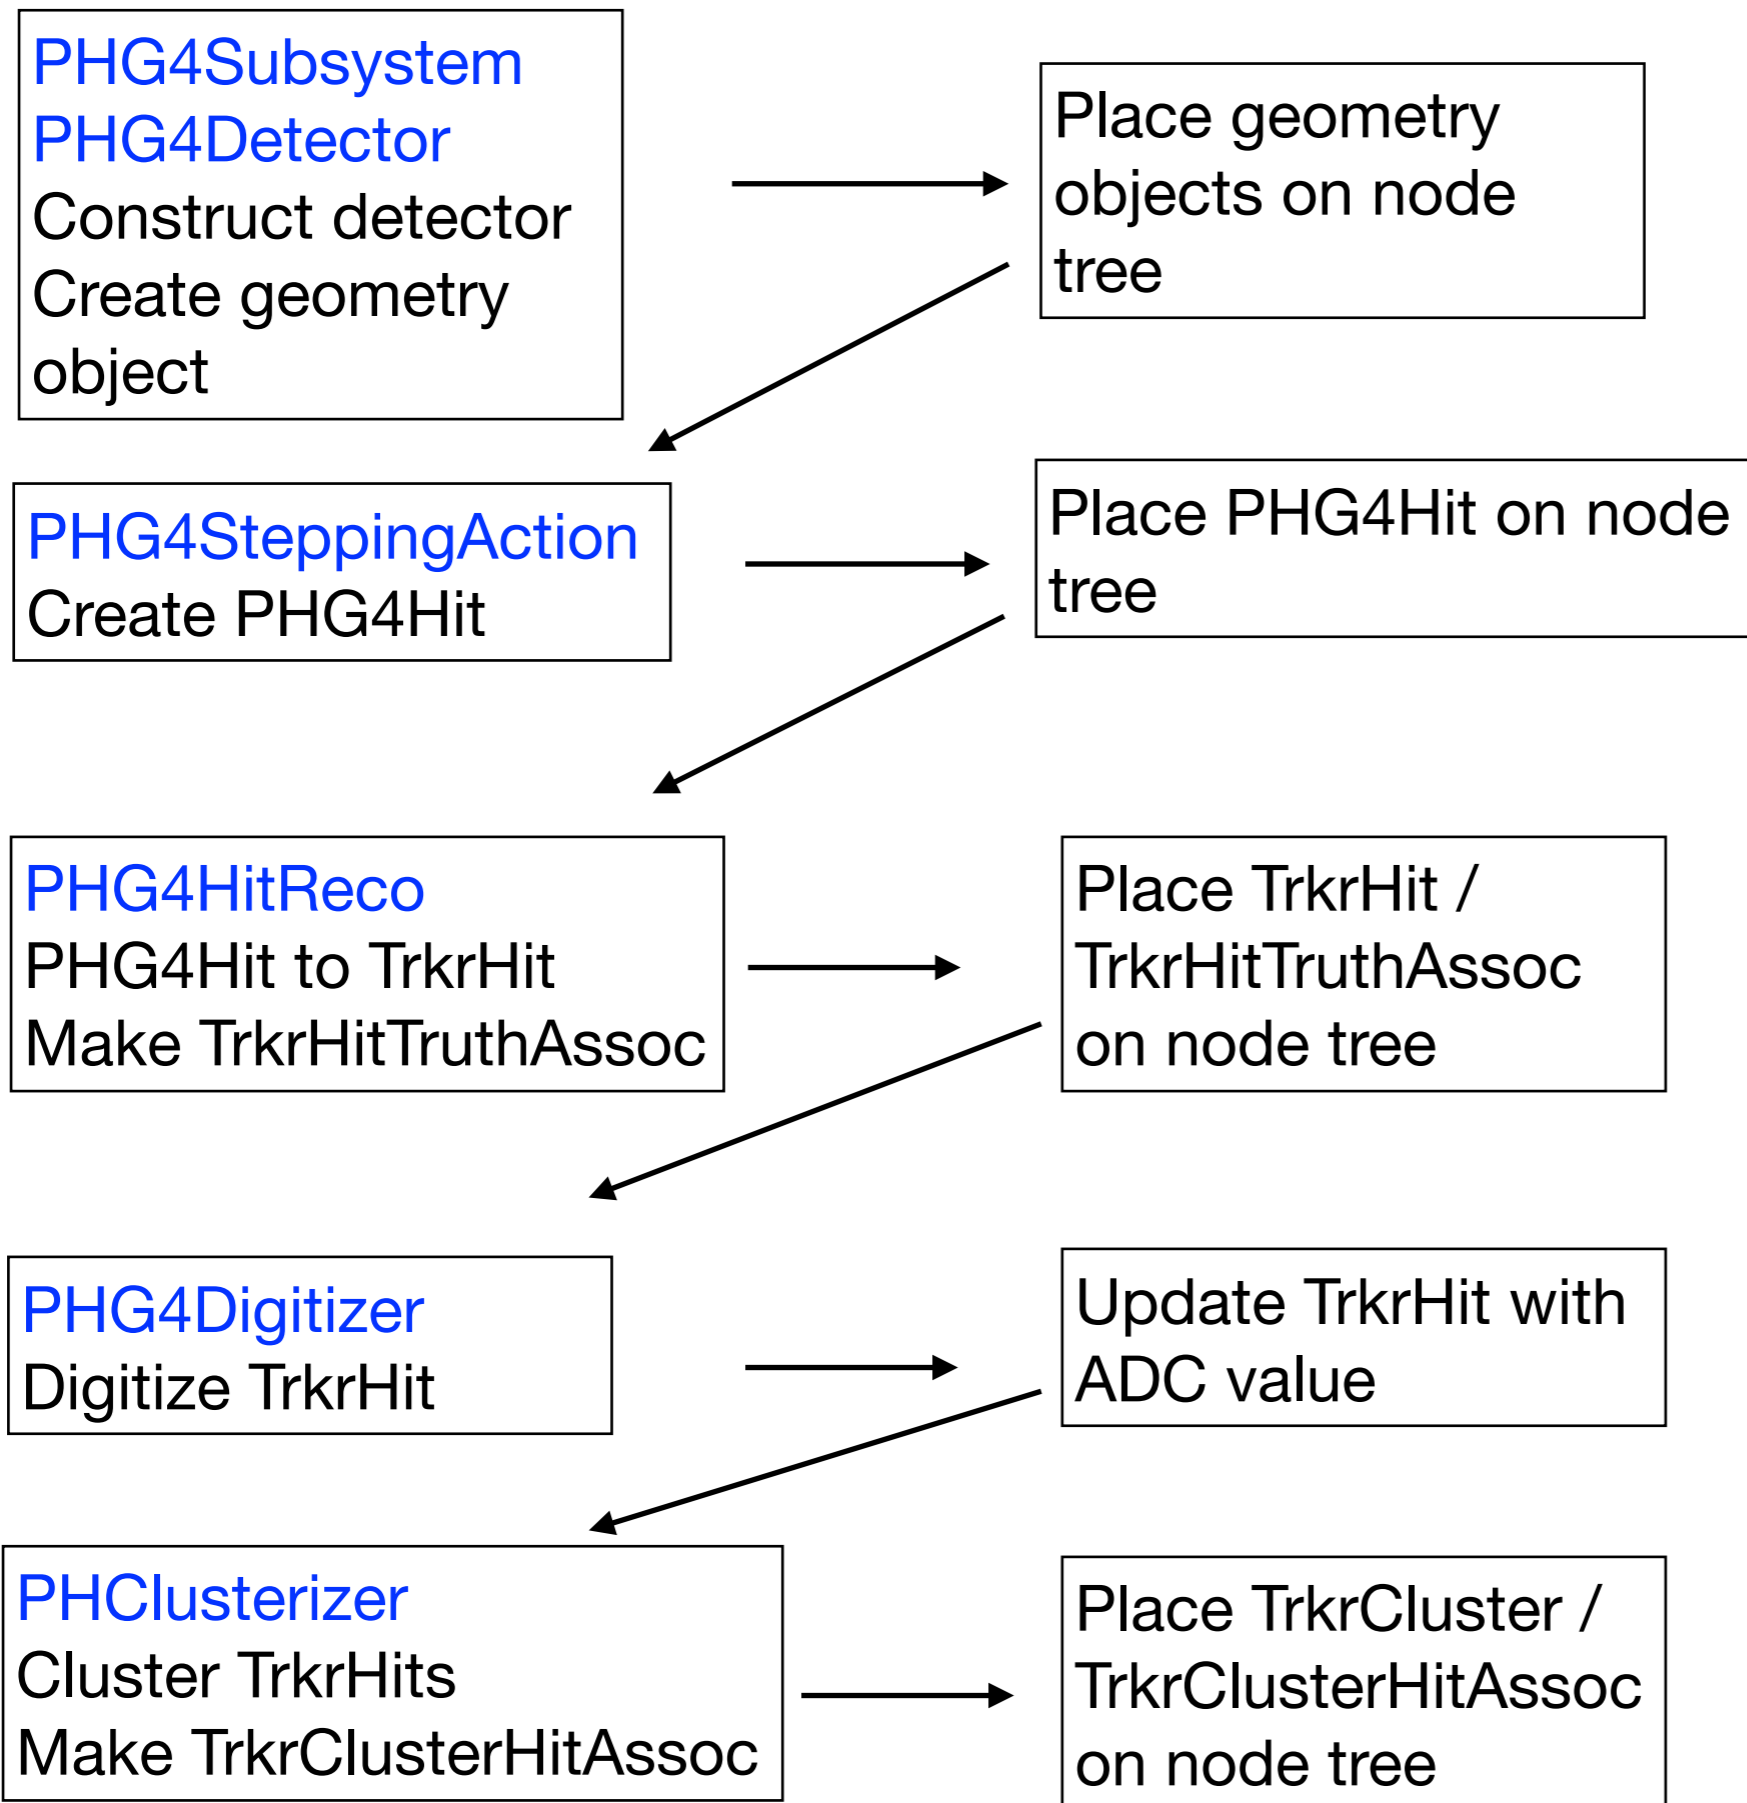

sPHENIX Workfest
January 13-17, 2019

Tracking Software Work in 2019

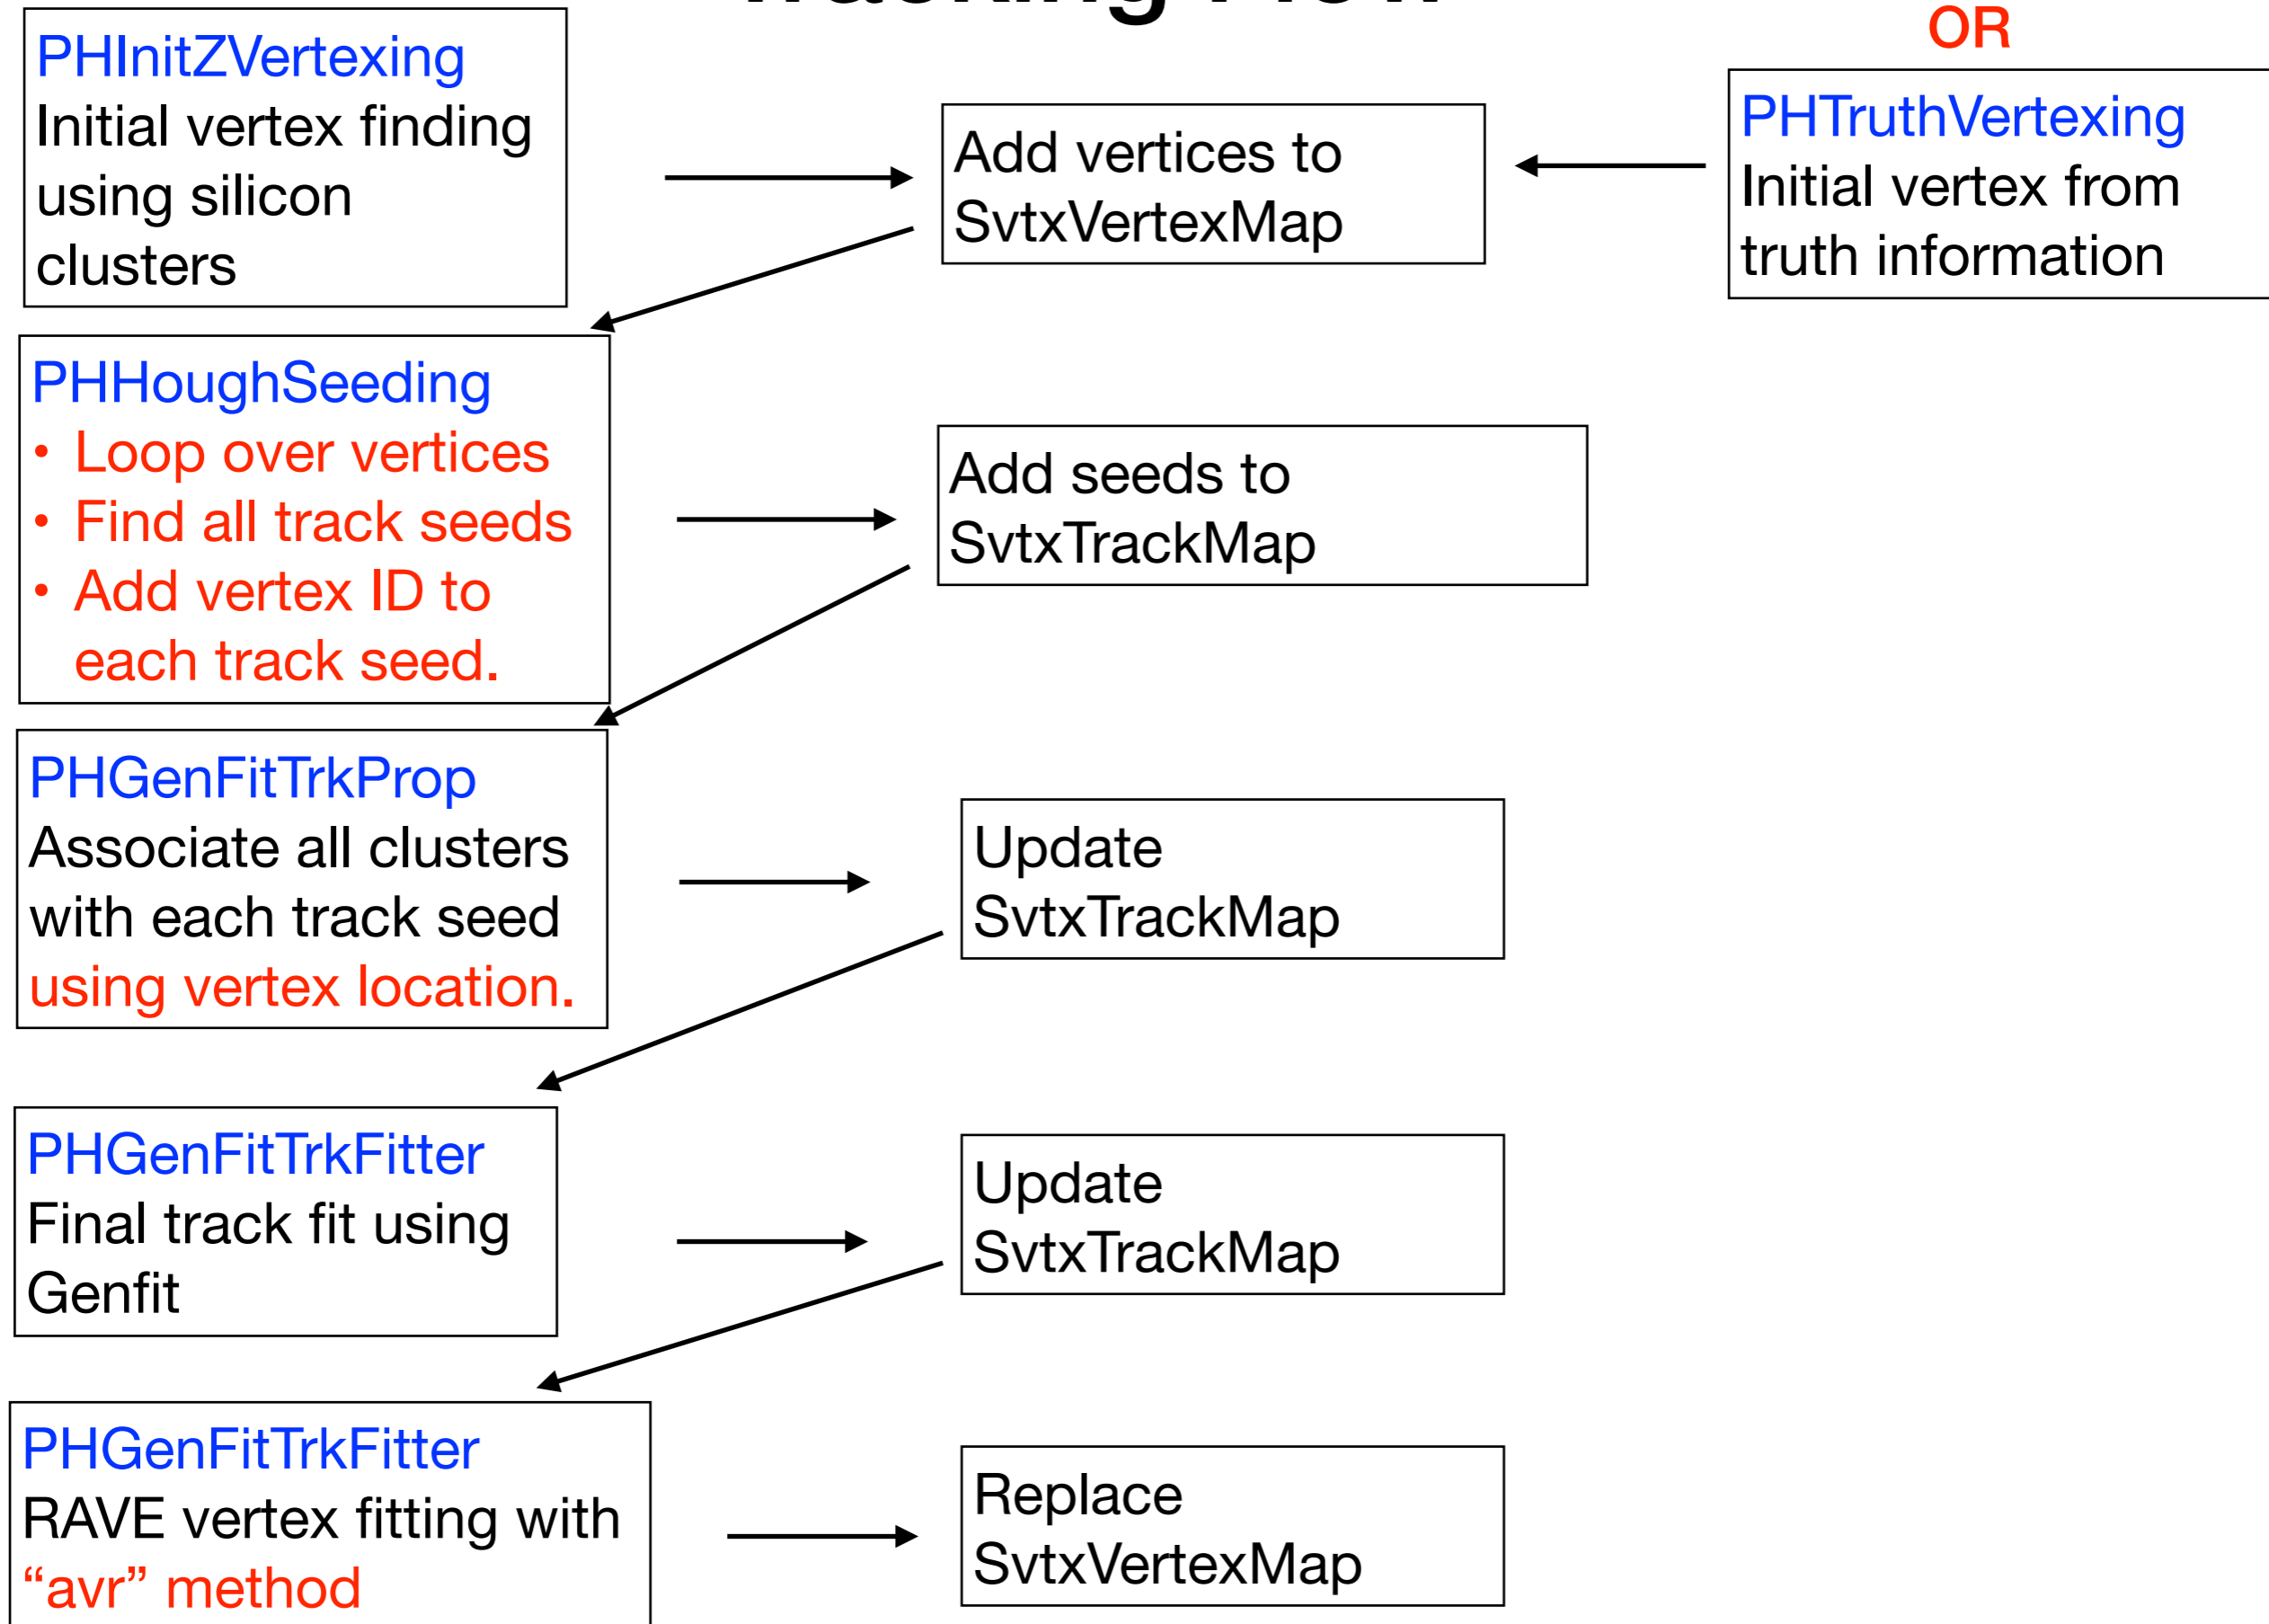

Focus in 2019 was on reorganizing and modularizing the tracking simulations and reconstruction code, and implementing new storage containers.

- All sims code moved to subsystem specific areas in g4simulations.
- All reco code moved to subsystem specific areas in offline/packages.
- Offline code modularized, and now inherits from base classes
 - To facilitate adding alternative methods.
- New tracking storage objects implemented
 - Reduced memory use by a factor of two.
- Event vertexing code using MVTX hits added
 - Previously used smeared truth vertex.
- Ability to track to multiple vertices in a single collision was added
 - Can do for truth vertexing or MVTX vertexing.
- Implemented multiple vertices in Rave final vertexing - but needs tuning
- Ongoing study of outer detector parameters for SC distortion corrections

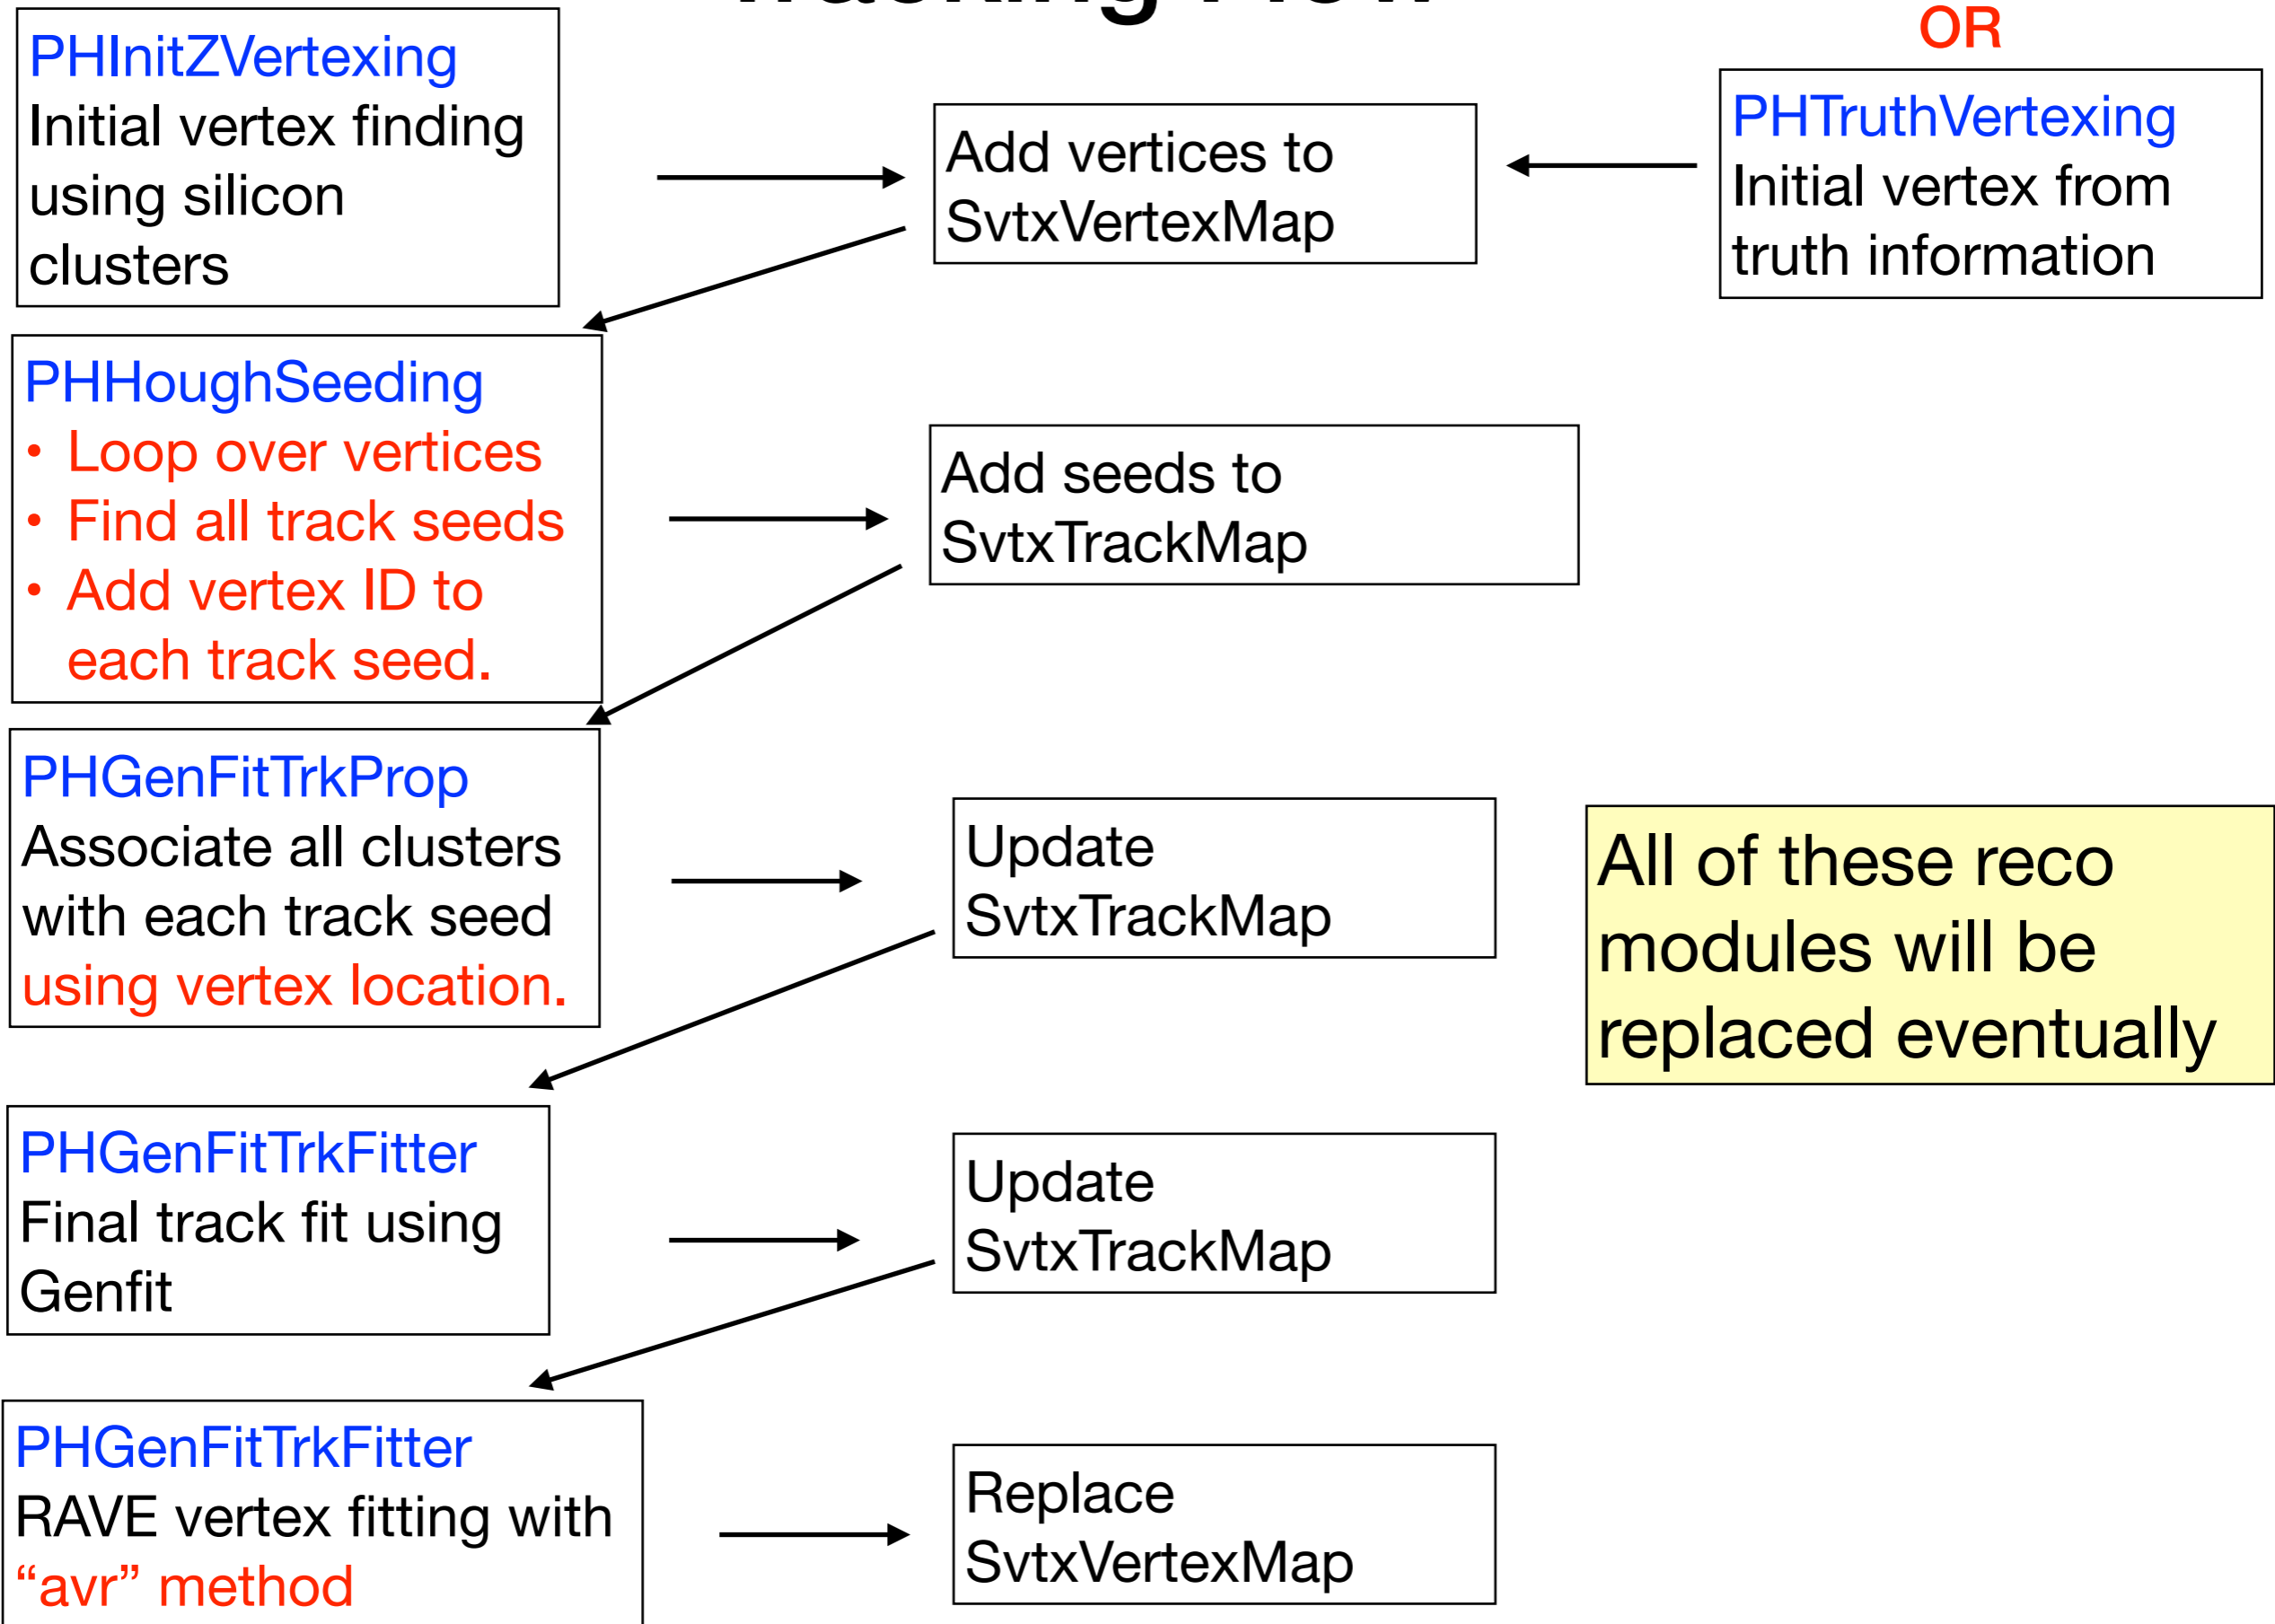

Simulations and clustering flow (each detector)

Tracking Flow

Tracking Flow

Known Issues

Tracking efficiency is lower by $\sim 5\%$ in low multiplicity events, worse in high occupancy events.

Existing Hough track seeding is very slow.

Genfit final track fitting fails mysteriously for a few percent of tracks.

TPC clustering is primitive, needs upgrade to better handle cluster overlaps.

Multi-vertexing needs tuning to limit spurious vertices - both initial and final. Also will need to consider cuts for analysis - not all vertices will be real.

TPC space charge distortions are not properly implemented in tracking.

Moving forward

- Implement TPC space charge distortions.
 - Ongoing: Ross Corlis heading up this effort.
- Do we need a new outer detector?
 - Ongoing: Hugo Pereira is making a study of what performance parameters would be needed.

Replace Hough track seeding.

- Christof working on new version. Wait for ACTS package instead?
- Replace tracking with ACTS.
 - Seems to be the (only) way for us to go
 - Includes replacement for final vertexing as part of package.
- Replace TPC clusterizer with more powerful one. Not the main priority yet.
- Track down loss of tracking efficiency after the container upgrade and modularization (which included new hit and storage objects, a new TPC clusterizer, and which was coincident with a new version of Genfit).
 - Before the January workfest, if possible
- Tune our initial vertexing code. Maybe it gets replaced, but it works!

Tracking Software - meeting priorities

Learn from experts while we have them here!

Tracking package **interface for ACTS**

- ACTS is really the only package we see as suitable at present
- Will need an interface from/to current vertexing, clustering

Track seeding

- Recent implementation by Christof
- Needs tuning

TPC distortion simulations - Ross

- Comparison of sPHENIX model with ALICE model to validate

Outer detector studies

- Try to define performance parameters by the end of the workfest.

Tracking QA - Jin would be able to help a volunteer set it up

Calibration and infrastructure - outline a plan in workfest

- Start to think through how to do it.
- Involves geometry and data storage containers.
- When we rotate or translate a detector, all points have to rotate or translate with it.
- Discuss with David Rohr how this is done in ALICE
