## Condensation in two flavor scalar electrodynamics with non-degenerate quark masses

Tuesday, 24 June 2014 18:10 (2 hours)

We explore two flavor scalar electrodynamics on the lattice, which has a complex phase problem at finite chemical potential. By rewriting the action in terms of dual variables this complex phase problem can be solved exactly. The dual variables are link- and plaquette occupation numbers, subject to local constraints that have to be respected by the Monte Carlo

algorithm. For the simulation we use a local update scheme.

Assigning two different fundamental masses to the two flavors of the underlying model we can achieve a mass splitting between the

single-flavor quark-antiquark bound states. We then introduce a finite chemical potential and study the particular characteristics of the systems condensation which we expect due to the mass splitting between the bound states.
