Hadron spectra and Delta_mix from overlap quarks on a HISQ sea.

Monday, 23 June 2014 16:50 (20 minutes)

We present results of our continuing study on mixed-action hadron spectra and decay constants using overlap valence quarks on MILC's 2+1+1 flavor HISQ gauge configurations. This study is carried out on three lattice spacings, with charm and strange masses tuned to their physical values, and with $m_l/m_s = 1/5$. I will discuss a determination of the mixed-action parameter Delta_mix, which enters into chiral formulae for the masses and decay constants.
