The low mass scalar impostor and the composite Higgs

Monday, 23 June 2014 16:50 (20 minutes)

The widely discussed near-conformal gauge theory with two fermion flavors in the two index symmetric (sextet) representation of the $SU(3)$ color gauge group is the minimal realization of the composite Higgs mechanism. A comprehensive study of flavor singlet scalar spectroscopy with Higgs quantum numbers is reported based on extended new data sets.
