## Outline

(1) Introduction

- BCNW-equation for the mass
- Improvement of BCNW-equation
(2) Considering parity mixing
- Parity mixing : $\theta \neq 0$ and fixed topology
- Consequences on mass extractions
(3) Application to SU(2) Yang-Mills theory
- Test method and parameters
- Results

## Outline

(1) Introduction

- BCNW-equation for the mass
- Improvement of BCNW-equation
(2) Considering parity mixing
- Parity mixing : $\theta \neq 0$ and fixed topology
- Consequences on mass extractions
(3) Application to SU(2) Yang-Mills theory
- Test method and parameters
- Results

## Mass relation

- Relation between mass in topological sector $Q$ and mass of QCD $(\theta=0)^{1}$.

$$
M_{Q}=M(0)+\frac{M^{(2)}(0)}{2 \chi_{t} V}\left(1-\frac{Q^{2}}{\chi_{t} V}\right)+\mathscr{O}\left(\frac{1}{\left(\chi_{t} V\right)^{2}}\right)
$$

## Conditions:

(C1) $1 / \chi_{t} V \ll 1$ and $|Q| / \chi_{t} V \ll 1$ : Taylor expansion and saddle point approximation.
(C2) $\left|M_{H}^{(2)}(0) t\right| / \chi_{t} V \ll 1$ : Taylor expansion.

[^0]
## Extracting the mass

- Relation between mass in topological sector $Q$ and mass of QCD $(\theta=0)$

$$
M_{Q}=M(0)+\frac{M^{(2)}(0)}{2 \chi_{t} V}\left(1-\frac{Q^{2}}{\chi_{t} V}\right)+\mathscr{O}\left(\frac{1}{\left(\chi_{t} V\right)^{2}}\right)
$$

Method to extract the mass from fixed topological simulation.

- Compute $M_{Q, V}$ or equivalently $C_{Q, V}$ for different physical volumes and topological sectors ( $C_{Q, V}$ two-point function at fixed topology and volume $V$ )
- Fit the BCNW-Equation to those results
(3 parameters $M(0), M^{(2)}(0)$ and $\chi_{t}$ )
- Extracting $M(\theta=0)$ and $\chi_{t}$

## Outline

(1) Introduction

- BCNW-equation for the mass
- Improvement of BCNW-equation
(2) Considering parity mixing
- Parity mixing : $\theta \neq 0$ and fixed topology
- Consequences on mass extractions
(3) Application to SU(2) Yang-Mills theory
- Test method and parameters
- Results

## Motivations for improvements up to $1 /\left(\chi_{t} V\right)^{3}$

Motivation to improve by $\mathscr{O}\left(1 /\left(\chi_{t} V\right)^{2}\right)$ and $\mathscr{O}\left(1 /\left(\chi_{t} V\right)^{3}\right)$
(1) Complete $\mathscr{O}\left(1 /\left(\chi_{t} V\right)^{2}\right)$ order in BCNW-equation.
(2) Increase precision
(3) Important when $\chi_{t} V$ is not to large e.g $\chi_{t} V \gtrsim 1$.
(3) Helpful to estimate the error of $\mathscr{O}\left(1 /\left(\chi_{t} V\right)^{2}\right)$ expansion.

Literature: General discussion of $n$-point functions at fixed topology including also higher orders in $1 / \mathrm{V}$. ${ }^{2}$

Our contribution: Expansion of two-point correlation function up to $\mathscr{O}\left(1 /\left(\chi_{t} V\right)^{3}\right)$

[^1]
## Improvement

## Improved equation ${ }^{3}$

$$
\begin{aligned}
& C_{Q, V}(t)=\alpha(0) \exp \left(-M_{H}(0) t-\frac{1}{\mathscr{E}_{2} V} \frac{x_{2}}{2}-\frac{1}{\left(\mathscr{E}_{2} V\right)^{2}}\left(\frac{x_{4}-2\left(\mathscr{E}_{4} / \mathscr{E}_{2}\right) x_{2}-2 x_{2}^{2}}{8}-\frac{x_{2}}{2} Q^{2}\right)\right. \\
&-\frac{1}{\left(\mathscr{E}_{2} V\right)^{3}}\left(\frac{16\left(\mathscr{E}_{4} / \mathscr{E}_{2}\right)^{2} x_{2}+x_{6}-3\left(\mathscr{E}_{6} / \mathscr{E}_{2}\right) x_{2}-8\left(\mathscr{E}_{4} / \mathscr{E}_{2}\right) x_{4}-12 x_{2} x_{4}}{48}\right. \\
&\left.\left.+\frac{18\left(\mathscr{E}_{4} / \mathscr{E}_{2}\right) x_{2}^{2}+8 x_{2}^{3}}{48}-\frac{x_{4}-3\left(\mathscr{E}_{4} / \mathscr{E}_{2}\right) x_{2}-2 x_{2}^{2}}{4} Q^{2}\right)\right) \\
&+ \mathscr{O}\left(\frac{1}{\left(\mathscr{E}_{2} V\right)^{4}}, \frac{1}{\left(\mathscr{E}_{2} V\right)^{4}} Q^{2}, \frac{1}{\left(\mathscr{E}_{2} V\right)^{4}} Q^{4}\right)
\end{aligned}
$$

## Improvement cost

- Increasing the number of parameters (3 for BCNW-equations, 8 for $1 /\left(\chi_{t} V\right)^{2}, 11$ for $\left.1 /\left(\chi_{t} V\right)^{3}\right)$

[^2]
## Improvement (2)

Problem for limited statistical accuracy
Possibility to benefit of the improvement while keeping the number of parameters small. $\Rightarrow$ New parameters set to zero
$C_{Q, V}(t)=\frac{\alpha(0)}{\sqrt{1+M_{H}^{(2)}(0) t / \chi_{t} V}} \exp \left(-M_{H}(0) t-\frac{1}{\chi_{t} V}\left(\frac{1}{1+M_{H}^{(2)}(0) t / \chi_{t} V}-1\right) \frac{1}{2} Q^{2}\right)$

- Evidence of the improvement in a toy-model ${ }^{4}$ (quantum mechanics on a circle with well potential)

[^3]
## Outline

(1) Introduction

- BCNW-equation for the mass
- Improvement of BCNW-equation
(2) Considering parity mixing
- Parity mixing : $\theta \neq 0$ and fixed topology
- Consequences on mass extractions
(3) Application to SU(2) Yang-Mills theory
- Test method and parameters
- Results

## Parity mixing due to the $\theta$-term

$$
S_{E}(\theta)=S_{E}-i \theta Q=S_{E}-i \theta \frac{1}{32 \pi^{2}} \int d^{4} x F_{\mu \nu} \tilde{F}_{\mu \nu}
$$

- The second term violates parity symmetry $P$
- Fixed topology superposition (Fourier transform) of theories with $\theta \neq 0 \Rightarrow$ not $P$ invariant

Consequences

- Consider two states, which are parity partners:

The heavier state has to be considered as an excitation, while the lighter is the ground state.

- A single correlator is generally not sufficient to determine the mass of an excited state precisely:
$\Rightarrow$ use a correlation matrix.

## Outline

(1) Introduction

- BCNW-equation for the mass
- Improvement of BCNW-equation
(2) Considering parity mixing
- Parity mixing : $\theta \neq 0$ and fixed topology
- Consequences on mass extractions
(3) Application to SU(2) Yang-Mills theory
- Test method and parameters
- Results

## Parity mixing at fixed $Q$

- Consider $O_{1}$ and $O_{2}$ with opposite parity.

$$
C_{Q}=\left(\begin{array}{cc}
\left\langle O_{1}^{\dagger}(t) O_{1}(0)\right\rangle_{Q} & \left\langle O_{1}^{\dagger}(t) O_{2}(0)\right\rangle_{Q} \\
\left\langle O_{2}^{\dagger}(t) O_{1}(0)\right\rangle_{Q} & \left\langle O_{2}^{\dagger}(t) O_{2}(0)\right\rangle_{Q}
\end{array}\right)
$$

If we neglect terms of order $\sigma\left(\frac{1}{\left(x_{\mathrm{t}} \boldsymbol{V}\right)^{2}}\right)$
$\left\langle O_{1}^{\dagger}(t) O_{1}(0)\right\rangle_{Q} \approx a_{11} e^{-M_{H_{1}}(0) t}\left(1-\frac{M_{H_{1}}^{(2)}(0) t}{2 \chi_{t} V}\right)+\frac{b_{22}}{\chi_{t} V} e^{-M_{H_{2}}(0) t}$
$\left\langle O_{1}^{\dagger}(t) O_{2}(0)\right\rangle_{Q} \approx \frac{i Q_{12}}{\chi_{t} V} e^{-M_{H_{1}}(0) t}+\frac{i Q b_{12}}{\chi_{t} V} e^{-M_{H_{2}}(0) t}$
$\left\langle O_{2}^{\dagger}(t) O_{1}(0)\right\rangle_{Q} \approx \frac{i Q_{21}}{\chi_{t} V} e^{-M_{H_{1}}(0) t}+\frac{i Q b_{21}}{\chi_{t} V} e^{-M_{H_{2}}(0) t}$
$\left\langle O_{2}^{\dagger}(t) O_{2}(0)\right\rangle_{Q} \approx \frac{\partial_{22}}{\chi_{t} V} e^{-M_{H_{1}}(0) t}+b_{22} e^{-M_{H_{2}}(0) t}\left(1-\frac{M_{H_{2}}^{(2)}(0) t}{2 \chi_{t} V}\right)$

## Masses at fixed $Q$

Now let us assume that $M_{H_{1}}(\theta=0)<M_{H_{2}}(\theta=0)$ :
The previous results yield:

- For $H_{1}$ :
$\left\langle O_{1}^{\dagger}(t) O_{1}(0)\right\rangle_{Q}=$
$a_{11} e^{\left(-M_{H_{1}}(0) t\right)}\left(1-\frac{M_{H_{1}}^{(2)}(0) t}{2 \chi_{t} V}\right)+\mathscr{O}\left(\frac{e^{-M_{H_{2}} t}}{\chi_{t} V}, \frac{1}{\left(\chi_{t} V\right)^{2}}\right)$
$\Rightarrow$ For large $t$, we can use what we have done in previous works
- For $\mathrm{H}_{2}$ :
$\left\langle O_{2}^{\dagger}(t) O_{2}(0)\right\rangle_{Q}=\frac{a_{22}}{\chi_{t} V} e^{\left(-M_{H_{1}}(0) t\right)}+\mathscr{O}\left(e^{-M_{H_{2}} t}, \frac{1}{\left(\chi_{t} V\right)^{2}}\right)$
$\Rightarrow$ Extremely difficult to extract $M_{2}$, needs a lot of statistics
$\Rightarrow$ Use the correlation matrix $\rightarrow$ fit all four expansions $\left\langle O_{i}^{\dagger}(t) O_{j}(0)\right\rangle$ at once.

## Outline

(1) Introduction

- BCNW-equation for the mass
- Improvement of BCNW-equation
(2) Considering parity mixing
- Parity mixing : $\theta \neq 0$ and fixed topology
- Consequences on mass extractions
(3) Application to SU(2) Yang-Mills theory
- Test method and parameters
- Results

## Parameters and method

## Parameters:

- Action: $S_{E}=\frac{1}{4} \int d^{4} x F_{\mu \nu} F_{\mu \nu}$, use standard plaquette action
- Observable: static potential $\mathscr{V}_{Q \bar{Q}}(R)$ for $R=1$ to 6
- $\beta=2.5$
- Volumes: $a^{4} V=(a L)^{4}$ with $L \in\{14,15,16,18\}$
- Number of configurations: 4000 per volume

Method to test the mass extraction from fixed topology:

- Compute $C_{Q, V}(t)$ for different $Q$ and $V$
- Fit the BCNW-equation or improvement
- Compare results to unfixed topology simulation

Systematic comparison:
(1) Using different number of volumes and different volumes
(2) Using weaker criterion $\frac{|Q|}{\chi_{t} V}<1$ or stronger one $\frac{|Q|}{\chi_{t} V}<0.5$ to admit topological sectors and volumes in the fit.

## Fitting

$a V_{q \bar{q}}$ for different top.sectors as a function of $1 / \mathrm{V}$ for $\mathrm{R} / a=6$

## String Tension

$a V_{q \bar{q}}$ as a function of $\mathrm{R} / \mathrm{a}$

## Topological susceptibility

## Examples:

For $a^{4} V=15^{4}$ and $16^{4}$

| eq. | $\mathscr{V}_{Q \bar{Q}}(\mathrm{a})$ | $\mathscr{V}_{Q \bar{Q}}(2 \mathrm{a})$ | Q $\bar{Q}$ (3a) | $\mathscr{V}_{Q \bar{Q}}$ (4a) | $\mathscr{V}_{Q \bar{Q}}(5 a)$ | $\mathscr{V}_{Q \bar{Q}}(6 \mathrm{a}$ |

- Large statistical errors

## Summary of results for SU(2)

- Clear Discrepancy between topological sectors observed $\rightarrow$ motivates our work (need to have a method to extract masses from fixed topological sectors)
- Rather precise to determine masses: $\left(\frac{|Q|}{\chi_{t} V}<1\right)$
- Improvements when using more volumes (still works reasonably well with two volumes)
- Reducing statistical errors using larger number of points for the fit (more topological sectors, more volumes)
- Topological susceptibility: large statistical error!
- Improved by increasing the number of topological sectors or number of volumes
- Not possible to determine $\chi_{t}$ with high precision.
- Improved equation is slightly better or as good as BCNW-equation

## Outlook

## Outlook <br> (1) Apply to QCD <br> (2) Apply it for the heaviest parity partner

Thank you for your attention!
