Tree level improvement of the gradient flow

Thursday, 26 June 2014 15:35 (20 minutes)

The Yang-Mills gradient flow is considered in lattice perturbation theory at leading order of the gauge coupling and $O(a^8)$ in the lattice spacing. Improved actions are incorporated for the gauge action, the flow itself and the observable for $E(t)$. The results lead to a setup with $O(a^6)$ improvement at tree level.
